X	Initial used for anonymous contributors.	

INDEX

The Index to the New Volumes XXX., XXXI. and XXXII. of the *Encyclopædia Britannica*, has been prepared on the same system as that used in Volume XXIX. Every Index has its own principles and its own conventions. Those adopted for Volumes I. to XXVIII. need not here be recapitulated; they are sufficiently explained in the preface to Volume XXIX. and in the Rules and Abbreviations which follow it. It is only necessary to add that in this supplementary Index the volume number is not repeated before successive references from the same volume, and that measures have been taken to avoid difficulties arising from variant spellings which have different initial letters, of Arabic and Slavonic names. All abbreviations used in this supplementary Index are explained in the Key beginning on page xv. of Volume XXX.

YACHTING: see SPORTS AND GAMES.

YALE UNIVERSITY (see 28.809*).—In 1919 President A. T. Hadley announced his decision to resign the presidency of Yale at the close of the university year; and on June 22 1921 his successor, James Rowland Angell, was inaugurated. Developments in 1910-20 were marked in many respects. The university's endowment increased from \$11,967,166.29 to \$24,048,730.45. The university began to be the beneficiary under the will of the late John W. Sterling of New York City, a graduate of Yale College, of about \$20,000,000, held by trustees for the university under his bequest. The money was to be used for memorial buildings and devoted "to some extent to the foundation of Scholarships, Fellowships or Lectureships, the endowment of new Professorships and the establishment of special funds for prizes." At the same time the university's property holdings were augmented, and several important buildings constructed, including the Osborn Memorial Laboratories, the Sloane Physics Laboratory, the Dunham Laboratory of Electrical Engineering, the Mason Laboratory of Mechanical Engineering, Sprague Memorial Hall (Music), the Brady Memorial Laboratory (Pathology), Artillery Hall and the Artillery Armoury, and the magnificent Memorial Quadrangle, the gift of Mrs. Stephen V. Harkness, of New York City. This quadrangle includes seven courtyards in collegiate Gothic, designed by James Gamble Rogers of New York City, and erected at a cost of several million dollars. It is recognized as one of the most perfect groups of modern Gothic buildings in the world.

The number of students in 1920 who were candidates for a degree was 3,214, practically the same as ten years earlier. Educationally the university underwent a thorough reorganization in its administrative and educational system to meet modern conditions. The medical school was allied to the New Haven hospital and placed on full-time basis; the law school introduced the requirement of a college degree for entrance, except for Academic Seniors; the undergraduates' courses in the Sheffield Scientific School were placed on a four-year basis; and the higher engineering degrees were transferred from the scientific school to the graduate school. Several new university officers were appointed, including a Provost, who represented the Faculties before the Corporation and assisted the President in the educational administration of the university; the Dean of Students, who was primarily concerned with student *moral*; and a Dean of Freshmen, who had under his jurisdiction all undergraduate freshmen. These were formed into what is called the Freshmen Year, at the close of which undergraduates pursued three years of study in the Sheffield Scientific School leading to the degree of Bachelor of Science, or three years of study in the college leading to the degree of Bachelor of Arts, or in the case of students without Latin, Bachelor of Philosophy. The admission of all students was centralized in a Board of Admissions, under a chairman appointed by the Yale Corporation.

In connexion with the literary activities of the university the Yale University Press was started in 1908, by Mr. George Parmly Day, the treasurer of the university, under an agreement with the university by which all books published and bearing the Yale name must receive approval in advance by the Yale University Council's Committee on Publications. The Press was affiliated with the Oxford University Press, and became an important publishing agency in America for works of a literary and scholarly character. The number of books published in 1919 was seventy-eight. The number of books sold was 184,145. The *Yale Review* was transformed in 1911 into a quarterly review under the editorship of Wilbur L. Cross, Dean of the Yale Graduate School, and it is recognized as one of the most representative organs of sober thought in America.

Eight thousand Yale men, including graduates, former students and students, entered the military and naval services of the United States during the World War. The university had the

most important artillery school in the country outside of Fort Sill and Camp Zachary Taylor. It also had one of the largest naval training units, and was the centre of the scientific work of the chemical warfare service. It was also the seat of the leading army laboratory school. Two hundred and twenty-five Yale men lost their lives in the service of their country. A memorial has been dedicated in their honour. (A. P. S.)

YAMAGATA, ARITOMO, PRINCE (1838-1922), Japanese field-marshal (see 28.902), died in Odawara, Japan, Feb. 1 1922.

YANUSHKEVICH, NIKOLAI (1868-), Russian general, was born in 1868 and entered the army in 1888. He passed through the academy of the general staff, and was appointed on the general staff. By 1909 he had reached the rank of general, but all his service was spent in the offices of the War Ministry, out of contact with troops. Very strict as a bureaucrat, he earned the special favour of the War Minister, Sukhomlinov, and, though he was quite untrained in the leading of troops in modern warfare (at the academy of the general staff he had taken an administrative course), he was, thanks to his even temper and enterprise, quickly promoted to the higher posts. Just before the World War he was appointed head of the general staff. Unable to introduce improvements, he limited himself merely to formal direction, which toned in well with the régime which the careless War Minister, Sukhomlinov, had established. With the declaration of war Yanushkevich, as head of the general staff, became the head of the staff of the supreme commander-in-chief. But at the commencement of operations, feeling himself completely unprepared for leadership on active service, he withdrew and left the work in the hands of his subordinates.

YARMOUTH (GREAT YARMOUTH), Norfolk, England (see 28.905).—The pop. had increased from 55,905 in 1911 to 60,710 in 1921. A new art school was opened in July 1913, and the esplanade was extended northward by about $\frac{1}{2}$ m.; in 1921 a town-planning scheme of a very comprehensive nature was in course of preparation. Yarmouth was subjected to zeppelin and other aircraft raids on Jan. 19 1915, April 24 1916, and Jan. 14 1918, and was bombarded from the sea on two occasions (Nov. 3 1914 and Jan. 26 1915); the material damage was slight.

YEATS, WILLIAM BUTLER (1865-), Irish author (see 28.909). In 1911, after the death of his friend J. M. Synge, Yeats wrote the essay *Synge and the Ireland of his Time*. His fervent Irish nationalism had been tried somewhat during his encounter with a section of the Irish public at the time of the *Playboy* disturbances in the Abbey theatre, and was further tried when the Dublin corporation refused a building for Sir Hugh Lane's collection of pictures. These affairs suggested to him a good deal of topical verse, especially in the most important of his later volumes, *Responsibilities* (Cuala Press, 1914). The volume includes the lines, familiar now in Ireland, "Romantic Ireland's dead and gone"; and as if to dwell a little longer in the Ireland of his earlier years, he wrote an account of these in *Reveries over Childhood and Youth* (1915). In his poetical work, from this period, he seemed to write with Synge's ideal of the poet in his mind, as one who "uses the whole of his personal life as his material." *The Wild Swans at Coole* (1917) marks the beginning of his preoccupation with the special doctrines expounded (1918) in *Per Amica Silentia Lunae*, a little prose treatise which the reader who wishes to understand Mr. Yeats' later work must study. Some of the poems in *Michael Robartes and the Dancer* (1920) are concerned with the events of 1916 in Ireland (the volume contains a sort of palinode to "Romantic Ireland's dead and gone"), but the author had become more and more a poet of esoteric doctrine. In literature and on the platform he had become a champion of belief in survival after death, a subject which interested him chiefly because of the possibility it offered of necromancy and "magic." "I have always," he says, "sought to bring my mind close to the mind of Indian and Japanese poets, old women in Connaught, mediums in Soho."

* These figures indicate the volume and page number of the previous article.

He was one of the first to welcome the English poems of Rabindranath Tagore, for whose *Gitanjali* he wrote an introduction. Another late influence with him was represented by the Noh-plays of Japan, and he wrote an essay on the subject which is included in the prose collection, *The Cutting of an Agate*. Under the Japanese influence he wrote his plays *At the Hawk's Well* (1917), and *Two Plays for Dancers* (1919). He married in 1917 Georgia Hyde Lees, by whom he had first a daughter and in 1921 a son.

An elaborate critical study of Mr. Yeats' poetry, by Forrest Reid, appeared in 1916; also, in the series "Irishmen of To-day," W. B. Yeats: *The Poet in Contemporary Ireland*, by J. M. Hone; there is a good account of Yeats' work in *Ireland's Literary Renaissance*, by Ernest A. Boyd (1916).

YELLOW FEVER (see 28.910).—In 1918 the study of this disease was carried a stage forward by the discovery of Noguchi that the disease could be transmitted to guinea-pigs, and that the blood of these, examined by dark-ground illumination, contained numbers of a delicate Spirochæte which he called *Leptospira icteroides*. This organism is closely allied to the *Leptospira icteroides morrhagiae*, the organism of infective jaundice.

It was found possible to cultivate the new organism under anaerobic conditions without excessive oxygen supply in solid media containing blood serum. Different strains of the organism vary greatly in virulence. Some are so virulent that 0.0001 c.c. of a culture is sufficient to induce fatal symptoms in a guinea-pig. The organism is killed within ten minutes at 55° C. and by desiccation or freezing. It is an extremely delicate filament, 4-9 μ in length by 0.2 μ in breadth. It breaks up into a number of refractile granules, and the virus can pass through Berkefeld filters V. & N. The organism is scanty in the blood of yellow fever patients.

Those early statements were confirmed by later work, and the chain of evidence in favour of this organism being the cause of Yellow Fever was well-nigh complete by the middle of 1921. Noguchi prepared a serum by infecting horses with his organism, and this exercised marked curative effects on guinea-pigs when administered within a short period of the time of infection. It was further found possible to infect a guinea-pig from a culture of the organism and then use a mosquito (*Stegomyia fasciata*) to carry the infection from this animal to another. The whole course of the disease could thus be reproduced by means of new organism. (R. M. W.)

YOSHIMITO (1879—), 122nd Emperor of Japan, third son of the Emperor Meiji (Mutsuhito), was born on Aug. 31 1879, at Tokyo. The Prince was physically somewhat weak during his early life and Marquis Tadayasu Nakayama and Marchioness Nakayama were appointed his guardians. On the eighth anniversary of his birthday the Prince was proclaimed heir apparent, the first and second sons of the Emperor Meiji having died in infancy. In Sept. 1887 the Prince commenced attending the Peers' school and on Nov. 3 1889 he was declared Imperial Crown Prince. In 1892 the Crown Prince was appointed to the rank of a first lieutenant in the imperial army, and two years later left the Peers' school to continue his studies at the palace under private tutors. In 1895 he was promoted to the rank of captain and in 1897 took his seat, in accordance with prescriptive right, in the House of Peers. In 1898 he was promoted to the rank of major of infantry and appointed a lieutenant-commander in the imperial navy.

On May 10 1900 the Crown Prince married Sadako, fourth daughter of the late Prince Michitaka Kujō, and on April 29 1901 a son, Hirohito, was born, followed by a second son, Prince Yasuhito, on June 25 1902, and a third, Prince Nobuhito, on Jan. 3 1905. In 1903 the Crown Prince was promoted colonel in the army and captain in the navy and in 1909 lieutenant-general and vice-admiral. On July 30 1912, at the moment of the demise of his father, the Crown Prince ascended the throne; but, owing to the national mourning, the formal ceremony of enthronement did not take place until July 31. In the following year, a fourth son, Prince Takahito, was born on Dec. 2.

YOUNG MEN'S CHRISTIAN ASSOCIATION (see 28.940).—For several years before the World War the British Y.M.C.A. had

been doing effective work in the summer camps of the Volunteers and Territorials. When the war started it had therefore the necessary experience, together with trained personnel and a programme adapted to meet the needs of men on active service. It entered the field at once, and within ten days of the outbreak of war had opened up 250 different centres for the recreation and welfare of the troops in all parts of the United Kingdom. The whole organization of the Y.M.C.A. was brought to bear on the national emergency, and the Red Triangle, unknown before the war, soon became as familiar as the Red Cross itself. It touched the men at every point and in almost every place. It became a habit—they found it in the training camps; the base camps overseas; the support trenches, and sometimes even in those in the front line. The Y.M.C.A. meant warmth, shelter, comfort and rest to the soldier on active service under Christian auspices. It was a counter-attraction to the "wet" canteen, and helped to keep the men from undesirable places in the towns and villages adjacent to the camps. It kept them in touch with home—more than a thousand million sheets of writing paper and envelopes being sent out from headquarters in London for free distribution at home and overseas. The steady effect of the work on the moral of the men was universally admitted. Sports and competitive games were organized on a large scale by the Association at a time when the army authorities had no leisure to devote to looking after the recreation of the troops. Education classes and lectures were included in the programme, and the Y.M.C.A. was appointed agent for carrying out the army scheme of education on the lines of communication in France. From May 1918 till the end of the following year 70,067 separate students were enrolled in the educational classes, and over 670,000 attended the lectures on the lines of communications. Wimborne House, London, was loaned by Lord Wimborne as headquarters of the overseas library, and more than a million books and magazines were sent to the front. The total cost of the educational work, which was carried out under the direction of a special committee on which all the universities were represented, exceeded £140,000. More than 150,000 concerts by professional artists were given, and in every case admission was free.

The primary object of all the work of the Association was the building and safeguarding of character. Religious work amongst the troops was organized on an extensive scale. Testaments, Gospels and religious booklets were distributed in hundreds and thousands. Family prayers in the huts usually closed the proceedings for the day, and, wherever possible, a quiet room or chapel was included as part of the equipment. Many distinguished preachers and evangelists served with the Y.M.C.A. The huts and tents were placed at the disposal of the official chaplains—Protestant and Catholic alike—every Sunday morning, and similar facilities were extended to the Jewish chaplains.

Personnel.—Twelve members of the Y.M.C.A. won the Victoria Cross during the World War, and the names of 2,621 are inscribed on the Roll of Honour in the central building in Tottenham Court Road of those who were killed or died when on active service. For its war work the Association had to depend almost entirely on men over military age or disqualified for active service, together with clergy and ministers of all denominations, whilst for the first time in its history women took a considerable part in the executive work of the Association. At one time there were as many as 40,000 ladies working under the Red Triangle. A splendid lead was given by H.H. Princess Helena Victoria, ably assisted by some of the leading ladies of the United Kingdom.

The Navy and Mercantile Marine.—During the war men of the Royal Navy had comparatively little shore leave, but many large institutes were opened in the naval bases and extensively used. After the Armistice work was opened up for the men of the British fleet based on Copenhagen. Y.M.C.A. cabinets, each containing a small library, writing materials, games, a gramophone and records, were supplied gratis to 200 centres for the use of men serving on coastguard, wireless, hydrophone and war signal stations.

Munitions.—To meet an urgent national need the Munition Workers' Auxiliary Committee was formed in 1915, with H.H. Princess Helena Victoria as president and Lord Derby as chairman. Two hundred canteens were opened before the end of 1918 in shell factories and other munition centres. Fifteen large hostels were established and more than 50 million meals supplied at cost price. Seven thousand voluntary women workers assisted. Lectures and concerts were given.

Prisoners of War.—In 1915 welfare work was initiated in the German prisoner-of-war camps at home by the late Mr. F. L. Porter, of the English National Council, but ultimately it was handed over to the American Y.M.C.A., and under their aegis extended to most of the European countries. In the British internment camps in Switzerland centres were opened at Murren, Leysin, Seeburg, Interlaken and Geneva, whilst in Holland the Association operated at Groningen, The Hague, Scheveningen, Rotterdam, etc.

Officers.—A similar work for officers to that carried on for the ordinary soldier was developed on the same lines, though on a smaller scale. The late Lord Brassey lent his mansion in Park Lane as a Y.M.C.A. club for overseas officers, and hostels were opened in London and the provinces, and also overseas.

Y.M.C.A. Work in London.—Tottenham Court Road, the White City and the Crystal Palace were amongst the biggest centres of Y.M.C.A. activity in London during the war. Ciro's was a popular mixed club. £250,000 was spent on erecting and equipping hostels for troops passing through the City, and from Dec. 1 1918 to Aug. 13 1919 1,359,494 service men slept in the Y.M.C.A. hostels in the metropolis, and 1,068,913 in those in the provinces. The grand total from Jan. 1916 to Nov. 1919 was 5,478,774. Primarily for the benefit of overseas troops, enquiry kiosks were opened up by the Y.M.C.A. International Hospitality League in Trafalgar and Leicester Squares, Charing Cross, Victoria and Euston stations, the Strand, and in Parliament Square. From Jan. 1918 to April 1921 826,338 men were dealt with by Y.M.C.A. street patrols; 1,195,496 were welcomed in the social rooms; 55,008 provided with free hospitality and entertainment in private homes; thousands of men were taken from the streets and assisted to their quarters; 301,548 were kept from the temptations of the streets by free entertainments in theatres and other places of amusement; 170,637 were piloted round historic London by honorary guides, whilst no fewer than 2,197,840 enquiries were actually registered at the enquiry bureaux.

Motor Transport.—969,970 service men on leave were conveyed free of any expense from station to station and from hut to hut by the Y.M.C.A. volunteer night motor transport during the war, and 254,000 after the Armistice. These figures apply to London alone, but similar service was rendered in many other parts of the country.

On the Western Front.—The Y.M.C.A. started work for the men of the B.E.F. in France in Nov. 1914. Centres were opened in all the bases, and, later, the Red Triangle appeared on ruined buildings, cellars and dug-outs up the line. In the great German advance in the spring of 1918 no fewer than 198 Y.M.C.A. centres were destroyed, involving a loss of £158,000. At the time of the Armistice there were more than 1,700 workers in France. Specialized work was carried out for Chinese coolies in 124 huts, and many centres were devoted to the use of the Indian troops and others opened for the Portuguese. 69,300 service men on leave stayed in the three Y.M.C.A. hostels in Paris. Seventy-seven Y.M.C.A. cinemas in France were attended by 35,000 men nightly. Y.M.C.A. service to the walking wounded and to the relatives of the dangerously wounded was given free of charge, and after the war many of the huts were retained as hostels for relatives visiting graves, and others for men working in the devastated areas.

In Italy 82 centres were operated by the Y.M.C.A.

Y.M.C.A. Work in the East.—There were 10 Y.M.C.A.'s in Malta, serving especially the hospitals and convalescent camps, and one in Gibraltar.

The Indian National Council did effective war work in Egypt and Palestine, France, England, Mesopotamia, and also in East Africa, where there were 51 war Y.M.C.A.'s, 32 being for British troops, 6 for Indians and 13 for Africans. In India there were 115 war Y.M.C.A.'s, 74 for British and 41 for Indian troops, and altogether 412 full-time salaried officers were employed. In Mesopotamia 102 centres were operated by 100 secretaries. The Y.M.C.A. had two steam launches on the Tigris. In Egypt there were 15 centres in and around Cairo, where the bourse was acquired as a hostel for troops, and the Esbekia gardens as a recreation centre. The Y.M.C.A. penetrated south as far as Khartoum and Port Sudan, and was established in 35 centres in the canal zone, 6 in Alexandria, and others in Cyprus, Beirut, Suez, Port Said and Aden. In Gallipoli work was opened up in Anzac Bay and at Cape Hellas. Thirty-five centres were opened in the base camps in Palestine and 25 actually in the front line, with extensions as far as Damascus and Aleppo. There were 65 on the Salonika front, and others in the islands of the Aegean and Adriatic. In 1915 a relief ship, the s.s. "Nero," was despatched with comforts and delicacies for the men serving in the Dardanelles.

Russia.—The main operations of the Association commenced in July 1918, and continued until the evacuation of the North Russian Expeditionary Force. In the Archangel district 35 centres were opened and 4 railway coaches were equipped as mobile Y.M.C.A.'s. In the Murmansk district there were 21 centres.

The Armistice.—With the close of hostilities a much wider field had to be covered; the men were more scattered, and transport—never easy—became increasingly difficult day by day. With the Armistice there came a constant flow of repatriated prisoners of war across the frontiers, whose first contact was with the Y.M.C.A. The men were practically starving, and more than 7,000 were fed

in Brussels alone, whilst large numbers were dealt with at Mons, Rotterdam, Aachen, Antwerp, Valenciennes, Vermelles, Nancy, Metz, Amiens, Lille and other centres. At all of these places, as well as at Cannon Street station in London, refreshments were given free at a cost to the Association of £50,000.

The Y.M.C.A. accompanied the British troops to Germany, and 5 big centres were opened up in Cologne, 3 at Düren, 79 for the use of corps troops, 6 on the lines of communication, and 8 on the Rhine demobilization boats.

Operations were on a big scale in Belgium, where a very strong Belgium Y.M.C.A. developed. Five thousand meals were served daily at the central Y.M.C.A. in Brussels, where there was sleeping accommodation for 1,600 men. The Hotel Weber was the largest Y.M.C.A. in Antwerp. Big centres were opened in Namur, Bruges, Ghent, Mons, Tournai, Roubaix, Aachen, Liège, Ostend, Zeebrugge, Spa, Beverloo and other places.

In Constantinople there was a large central Y.M.C.A. and tea gardens overlooking the Golden Horn, whilst several other branches were opened in the vicinity. In the Dardanelles centres were opened at Chanak, and Kum Kale. In the Caucasus there were centres at Batum, Tiflis and Baku. In southern Russia at Taganrog, Novorossisk and Ekaterinodar. There were eight posts on the Vardar and Doiran fronts. A mobile railway Y.M.C.A. ran between Salonika and Constantinople. There were three Y.M.C.A.'s on the Danube, and seven along the Anatolian railway.

In Serbia centres were opened at Monastir, Uskub, Velles, Nish, Belgrade and Mitrovitsa.

Work for Ex-soldiers.—During the closing stages of the war a Y.M.C.A. labour exchange was opened in London. Within two and a half years 29,000 ex-service men had been placed in situations, and more than 19,200 enquiries registered regarding pensions, allowances and other matters of vital interest to the ex-soldier. Seven large hostels and many huts were set aside for the use of demobilized men in London, and others in the provinces. Training schemes were carried out at Kinson (Dorset), Wokingham and in London.

Finance.—The total net cost of the work in all the war areas (excluding goods purchased for sale) was £8,189,406. This cost was met as follows: gifts from the public, £2,848,374; grants from American, Canadian and Australian Y.M.C.A.'s, £448,082; gross "profits" on sale of refreshments, £3,625,522; receipts from beds, baths and billiards, £369,756; proceeds of sales of properties and equipment, £212,574; sundry other receipts, £78,321; payment by War Office in respect of services rendered, £610,500. That left the Association with a surplus in hand of £3,723 with which to begin its extensive and costly after-war work for the troops.

It is interesting to note that out of every £1 spent on the war work of the Y.M.C.A. 6s. 11d. came from the public; 1s. 1d. from the American and Dominion Y.M.C.A.'s; 9s. 9d. from gross "profits" on sale of refreshments and receipts from beds, baths and billiards; 9d. from the sale of properties and equipment and sundry sources; 1s. 6d. from the War Office.

It will thus be seen that there were no net profits from the war work whatever. Every penny of the gross "profits" on sales of refreshments, etc., was spent upon the work, and the Y.M.C.A. had every reason to be proud of its business record in this matter. The prices to be charged were fixed by the military authorities, so that there was no question of profiteering. The Y.M.C.A. began without any intention of becoming a trading concern in any respect, but it was soon evident that by supplying cheap refreshments it had its biggest opportunity. The scope of the work was enormous; the total sales amounted to £17,387,804, and the percentage of gross "profits" was 20.8. The great bulk of the turnover consisted of the sale of penny cups of tea, penny buns, etc. No less a sum than £991,216 was returned to the troops in the form of direct gifts, including free stationery, games and sports, concerts and lectures, hot cocoa and refreshments given free at night in danger areas; to the walking wounded; to returning prisoners of war, and in hospitalities to the relatives of the wounded. (A. K. Y.)

UNITED STATES

The activities of the American Y.M.C.A. in connexion with the World War were so extensive and novel in character that its normal routine of work was eclipsed. But the usual educational and physical work continued through the decade 1910-20 and the Association experienced a healthy growth. In 1910 there were in the United States and Canada 2,017 associations with 496,591 members, of whom 91,756 were boys; the total operating expenditures were \$7,809,625, and the total net property and funds \$60,377,122. In 1920 there were 2,104 associations with 868,892 members, of whom 199,615 were boys; the total operating expenditures were \$38,484,800, and the total net property and funds \$128,019,000. In the summer of 1916 when the National Guard was sent to the Mexican border, the Y.M.C.A. followed and afforded help and means of recreation for some 150,000 troops. For this purpose over \$300,000 was raised during its

eight months' service there, and 42 buildings and 6 tents were provided as social centres. The estimated attendance at entertainments during that period was 2,851,316, and free stationery for over 5,000,000 letters was furnished.

The Y.M.C.A. began its work in Europe immediately after the outbreak of the World War in 1914. It helped the French and British troops in Europe and the Near East and the Russians. Arrangements were made with the belligerents, both Allied and Teutonic, for assisting prisoners of war. Huts were erected in the various prison camps, secretaries detailed, and recreation provided for large groups of restless men. In conjunction with the Red Cross, kitchens were built and attendance provided for the sick. During the first 17 months of the war \$300,000 was raised in America by the Y.M.C.A. for this work. Before America entered the World War in 1917 the Association had expended in Europe more than \$1,500,000. Immediately after the breaking of relations between the United States and Germany the Y.M.C.A. offered its services to the U.S. Government and the offer was accepted. A week later the War Work Council of the Association was organized, and to it was given the task of adapting the usual Association programme of recreation, education, and religious work to the needs of the national army. This Council was composed of some 200 well-known business and professional men, with some members of the Association. Considerable experience in work with soldiers had already been gained by the Association, as noted above. Its activities had made the organization known to military authorities in all countries, and had given it a body of men trained for the new task.

The local Associations in the United States at once opened their buildings and offered their advantages to all men in the U.S. service, an arrangement that continued till three months after demobilization. The raising of funds was put in charge of men prominent in their communities. The first drive was made during one week in April and May, and the second in Nov., the two raising over \$58,000,000. The final drive was that of the United War Work Campaign the Association's share of which was \$100,760,000. Committees, corresponding to the military departments into which the United States were divided, were formed to secure men and women for the work at home and abroad, the headquarters at New York having special oversight of those going overseas. When the nature of the overseas work and the need of large numbers of secretaries became clear, each candidate was required to take a week's course of preparation, that for the women being held at Barnard, that for the men first at Princeton and later at Columbia University.

Within a month after the declaration of war huts were equipped in the permanent camps already opened in the United States. During the two years following 1,200 of these stations were carried on for the men in training; 952 of them were huts built by the Association, most of them being ready on the arrival of the men. Huts were opened also in the munition and shipbuilding and other government plants, as well as in the internment camps, and work was continued with the troops on the Mexican border, at Panama and in the Philippines. Workers were on more than 5,000 troop trains, and also on the transports, where they showed motion pictures and supplied games, reading matter and such small conveniences as the men lacked. Over 12,000 men and women were on the regular staff, carrying on the varied duties of the hut and transportation service, and besides these were hundreds who gave part time.

The type of building used in the home camps and overseas had been adopted by the Association during service on the Mexican border. It was a wide, low structure, of upright boarding, easily transported in sections. One large room served in the smaller camps as lounge, writing and reading room, library, gymnasium, theatre, church and restaurant, while in the larger camps smaller rooms opening from this main room separated the different activities. The plan of the Association was to provide the men with attractive meeting places, conveniences for letter writing, books, papers, athletics, entertainments, classes and religious services. Lecturers, musicians and actors were on circuit among the huts, and motion pictures, carefully selected by the Community Motion Picture Bureau, were given at most points twice a week.

The work for the American Expeditionary Force in Great Britain, France, Italy, and Siberia, although of shorter duration than that in the United States and reaching fewer men, attracted more attention both because it was carried on under greater difficulties and because it developed features entirely new to welfare work among soldiers and sailors. In Great Britain Eagle Hut in the Strand, London, was the first of the 1,500 "huts" or stations, ranging from hotels and large buildings at sources of supplies to dugouts in the Argonne, which within 14 months were established overseas. More than 8,000 Y.M.C.A. men and women worked overseas with the A.E.F. between July 1917 and Dec. 1919.

The acceptance by the Y.M.C.A. of the army post canteen service, at the request of Gen. Pershing, which set free for military duty many hundreds of officers and soldiers, added greatly to the task of the Association, and being a business foreign to its programme and new to its personnel was handled with much difficulty. In connexion with this work the Y.M.C.A. met with much criticism, some of it probably warranted, much of it hardly fair under the

circumstances. Under Gen. Pershing's orders the Association was to obtain the goods, purchasing in the open market, and to sell at prices covering the cost and the transportation charges. The first cargo of supplies was torpedoed. As the sending over of troops increased it became more difficult to secure transportation for the Y.M.C.A. supplies. The Association was therefore early forced to open factories in France, 42 in all, and to manufacture for itself huge quantities of chocolate, cocoa, biscuit, candy and jam, just as it had to manufacture paper in Spain to supply its stationery. This meant high cost and therefore high prices for the commodities and a dissatisfaction among the men purchasing them. Initially the prices charged by the Y.M.C.A. were higher than those charged by the quartermaster's department of the army, and this led to a suspicion, unfounded though very prevalent, that the Y.M.C.A. was seeking to make a profit at the expense of the fighting men. Resentment on this score was increased because of the belief that the people of the United States had contributed huge sums to the Y.M.C.A. for the purpose of giving free supplies to the soldiers. But the Y.M.C.A. had expressly decided at the outset not to give away supplies except at the front lines, and it never solicited funds for this purpose. The prices charged in the canteens were later reduced, and for the most part goods were sold at a loss. At the request of the Association the canteen service was taken back by the army after the Armistice, when officers and men could be spared for this work. Had not the Governments of the United States and France decided to remit transportation charges to all the welfare organizations, the Association would have lost about \$1,500,000 on its post canteen service. With the remission of these charges, however, it found itself with a balance of \$500,000, which was handed over to the American Legion.

Secretaries were attached to each division of the A.E.F., but whether they should go forward with the troops, or how many should go, was decided by the individual commander. The work at the front consisted of the free distribution of cigarettes and whatever other supplies could be brought up, the serving of hot chocolate to the passing troops and work in the field hospitals and dressing stations, the front being the one place where the Association was allowed to work for the wounded. Over 700 Y.M.C.A. men and women were under fire, at Soissons, at Château-Thierry, in the St. Mihiel drive, and in the battle of the Argonne. Fourteen lost their lives and 133 were wounded or gassed in the battle zone, while 67 died from accidents or other causes. The Croix de Guerre was awarded to 41 and the Distinguished Service Cross to four. The entire personnel attached to 12 of the divisions was officially commended for front line service. Two hundred and fifty secretaries, both men and women, were either decorated or received special mention for their services.

Religious work, always a part of the Association programme, continued overseas as in the home camps. The huts were open for services of all faiths. There was always one service on Sunday, sometimes two, and sometimes another during the week. In many of the leave areas there were services daily. Most huts also had classes for Bible study. A special collection of hymns was prepared for use in the huts; much religious literature and many Testaments and portions of the Bible were distributed. A number of well-known clergymen, who had proved their strength with soldier audiences, made a circuit of the army, song leaders often going with them. Direct effort in the line of social purity was made by the Association, both in its practical work with the Hospitality League, on the streets of Liverpool, London and Paris, and in lectures in the huts by men specially fitted for this work.

The entertainment work in England and on the continent began in the fall of 1917 with a few musicians and speakers. Under E. H. Sothorn and Winthrop Ames the Over There Theatre League was formed, and under its care singers, actors, magicians, professional entertainers of all sorts, were enlisted for the entertainment of soldiers both in the United States and overseas. The Entertainment Department of the Association and the League together recruited over 1,400 entertainers, many of whom, after the Armistice, became trainers of the 15,000 soldier actors and musicians who made up the soldier shows of the A.E.F. For this department the Association provided instruments, music, costumes, and finally really entered the dramatic profession as owner of four "play factories," which were the centres of training and equipment for the soldier shows. Motion pictures were supplied regularly to all the huts, and were often given in the French village streets where there was no adequate building, and on the roadside, as with the troops on the march into Germany. Films were supplied to U.S. troops in Great Britain, Italy, and Siberia, to the French *foyers* and the Italian *casse*, to the Chinese labour battalions, the Portuguese and Russian troops in France, and the prisoners of war. Besides this the Association furnished films to all the other American welfare organizations overseas.

The question of what to do with the American soldiers on leave began to concern both French officials and American officers almost before any men had reached France. The Association proposed that it should take over certain regions, chosen by the French Government and run them as pleasure grounds for soldiers' holidays. The first opened was at Aix-les-Bains which was followed by 35 others the largest being those on the Riviera. Here some of the

most famous pleasure resorts of Europe were thrown open to the enlisted men. Many casinos became their clubs. Sight-seeing trips, dances, tournaments, concerts, plays, and motion pictures were provided, and more than a million men were given decent and wholesome enjoyment while on leave.

Though French classes and lectures were provided at the permanent camps by the Association little educational work was done before the Armistice. An educational plan for the whole army, however, was then ready. It included classes for all grades from illiterates to university students, and made use of teachers found in the ranks as well as those brought from the United States for the purpose. It also included privileges at French and English universities. In March 1919 the entire educational work was turned over to the Army Educational Commission. Though demobilization went on too rapidly to permit a full test of this work, it showed itself to be so practical and valuable that it was adopted as a regular part of the U.S. army system.

A special feature of the Association work overseas taken over by the U.S. army was the use of women as welfare workers in the camps. Women were accepted in order to save men for military service, but their duties were supposed to be confined to preparing and serving food. Distinctions of sex in service, however, disappeared under the pressure of work, and women managed *cafeterias* or concerts, religious meetings or "hikes," led dances or maintained "mother's corners," were decorators or scrubbers, as need arose. So evident was the acceptability of service by women that not only have women been included among the welfare workers under the U.S. War Department, but the Associations in the armies of Greece and Poland and the French *foyers* include them in their personnel.

The Soldier's Remittance Bureau was established to meet the difficulty the soldiers had in reaching the army post offices. By this plan any secretary, anywhere, could send a soldier's money home for him free of charge. Money was thus taken not only at the sources of supply but at the front, where days might pass before it could be handed in at the local headquarters, and many more pass before it could reach Paris, by the usual channels. These remittances numbered 351,468, and were sent to destinations in many countries. Only 92 remained undelivered by reason of wrong address or the disappearance of the payees. The soldiers sent home in this way, free of charge, \$1,558,339, the average length of time from acceptance to delivery being 62 days.

The favourite athletic recreations of the A.E.F. were informal baseball and group games until after the fighting was over. The Association's part in such activities before the Armistice was mainly in supplying equipment. But before Nov. 11 1918 the physical directors of the Association had proposed an inter-allied meet to celebrate victory. This plan was laid before the commander-in-chief, and, shortly after the close of hostilities, was approved and a committee appointed consisting of two officers and two Association men. The invitations to the Allies were sent out by Gen. Pershing, and the training of teams throughout all the armies went on during the winter of 1918-9. In the meantime a large stadium was building near Paris, the labour being given by the army, the land by the French, and the plans and the material supplied by the Association. For a fortnight in June and July 1919 1,500 contestants competed, representing 18 countries, all fellow soldiers in the World War.

As the result of an increasing volume of criticism, much of which, as already noted, was concerned with the conduct of the canteen service, the Y.M.C.A. in Dec. 1918 invited a committee composed of George W. Perkins, Mortimer L. Schiff and F. S. Brockman, none of whom had been connected with the Y.M.C.A. before the war, to go to France and make an investigation. Subsequently the War Department also undertook an inquiry. In the meantime the attitude of returning soldiers made it evident to the people of America that in France, at least, the Y.M.C.A. was held in less regard by the A.E.F. than certain other welfare organizations. Apart from the canteen question, soldier opinion seemed to point first to an unfortunate selection of some of the Y.M.C.A. personnel, and second to a well-meaning but sometimes officious effort to promote the moral and religious welfare of the A.E.F. It is clear that the validity of such criticisms will depend somewhat on the point of view. In his report on the work of the Y.M.C.A. Mr. Perkins, as chairman, said that in civilian life an organization that is 90% efficient is regarded as satisfactory. "If 10% of the 11,229 people operating in France for the Y.M.C.A. were inefficient," he continued, "it would mean that there were 1,122 men and women who were more or less of a failure. I do not believe anything like this number of people were unsuccessful." While Mr. Perkins found a number of instances of mistakes and bad judgment in the conduct of the Y.M.C.A. work, his general conclusion was that the organization deserved high praise for the manner in which it had accomplished a difficult task. A similar conclusion was reached by the War Department, and on several occasions Gen. Pershing expressed the opinion that the Y.M.C.A. had been unjustly blamed for circumstances over which it had no control.

Although with the return to the United States of the Expeditionary Forces the welfare work for the army and navy was taken over by the War and Navy Departments, at the request of the officers the Association was retained for service with the Army of Occupation in Germany. This work continued with a personnel of

about 120, half being women. Huts were continued also for the navy and for the merchant marine in various foreign ports. Another outgrowth of the war work was the Soldier Scholarships. Under grants from the Association some 55,000 ex-service men continued their studies, in colleges, technical schools, or correspondence courses.

Service to prisoners continued throughout the war, and as late as 1921, when there were still Russian prisoners in Germany and Poland, Y.M.C.A. secretaries were with the Czechoslovak troops during their journey across Russia after their internment in Siberia. Association workers also met the thousands of German, Austrian and Hungarian prisoners when they at last reached eastern Siberia; and secretaries either went with them on the transports that finally bore them to their homes, or supplied motion picture outfits, paper, books and comforts for the men's use during the long voyage.

Perhaps the best comment on the war work of the Association is found in the requests from certain of the Allied Governments, whose officers saw the work in France, for its introduction into their armies. In answer to such demands the Association was organized in the armies of Poland, Czechoslovakia, Rumania, Greece and Portugal, and American workers remained with the *foyers* in France.

YPRES (see 28.041).—Pop. (1914) 17,407. The town, though never taken by the Germans, was systematically bombarded from Nov. 1914 to May 1915, and it remained a "salient" of the Allied armies throughout the World War. The terrific attacks to which the town was exposed during the war resulted in its almost entire obliteration. The famous Cloth Hall became a scarcely recognizable ruin; of the cathedral of St. Martin, only part of the eastern doorway remained intact, and most of the works of art in the church were destroyed.

YPRES AND THE YSER, BATTLES OF.—Under this heading, accounts are given of the main battles in this area of the Western Front: those of 1914, 1915, 1917 and 1918.

I.—BATTLES OF OCT. 12—NOV. 20 1914

General Situation.—The Belgian army, after its unsuccessful defence of Antwerp, had retired by way of Ghent and Bruges to the line of the Yser, between Dixmude and the sea, where it had established itself by Oct. 12. It consisted of six infantry and two cavalry divisions, in all about 48,000 rifles, with 300 guns; the 2nd, 1st and 4th Divs. in that order from the N. held the front from the coast as far as Dixmude, with two brigades of the 3rd Div. and the 2nd Cav. Div. in reserve behind. A brigade of the 3rd Div., a French Fusilier Marine Brigade, which had been sent up to the N. to assist the Belgian army, and the 5th Div. continued the line from Dixmude to Boesinghe, while the 1st Cav. Div. screened the whole front of the army. Farther to the S. the 87th and 80th French Territorial Divs. were coming into line E. of Ypres, on the left of the British IV. Corps (7th Div. and 3rd Cav. Div.) which was falling back from Ghent, where it had been posted to cover the right flank of the retiring Belgian army, by way of Thielt and Roulers to the S. and E. of Ypres.

To the right rear of the IV. Corps the remainder of the British army was advancing. The II. Corps, detrained at Abbeville, had pushed forward to the line of the Aire-Béthune canal, and was on the 12th advancing further to the line Givenchy-Merville, meeting with stubborn resistance from the German XIII. Corps. To the left front of the II. Corps the French I. and II. Cav. Corps and the British Cav. Corps were driving before them the German IV. Cav. Corps and had reached the area of Vermelles, and Estaires to the S. of the Lys and Merville, Merris, and Cassel to the N. of that river. Behind the British cavalry the III. Corps, detrained at St. Omer, had reached the region of Hazebrouck. The I. Corps was not yet up from the Aisne; in fact its leading units were only entraining on this day and its transport to Flanders was not to be completed till the 19th.

In face of these forces the right wing of the German VI. Army, under Prince Rupprecht of Bavaria, consisting of the XIII. and XIX. Corps, and covered on front and flank by the I., II. and IV. Cav. Corps, were moving into position on both sides of Lille, extending as far N. as the Lys, and beyond. To the N. of this army a new one was moving forward with the object of forcing back the Allied left and securing possession of the Channel ports. This Army, the IV., under the command of Duke Albrecht of Württemberg, consisted of the newly formed XXII.,

YPRES AND THE YSER, BATTLES OF

XXIII., XXVI. and XXVII. Reserve Corps together with the III. Reserve Corps, from Antwerp, and the 4th Ersatz Div. These new corps were detaining S. of Brussels on the 12th, covered by the III. Reserve Corps and the 4th Ersatz Div.

The Allied Plan.—On Oct. 4, when it became clear that the forthcoming operations in Artois and Flanders would of necessity be carried out not only by French but also by British and Belgian forces, Joffre had entrusted Foch with the coordination of the Allied contingents in the N. The French X. Army (Maud'huy), around Arras, thus came under Foch's command and formed his right wing, while to reinforce the British in the centre and the Belgians on the left, there was formed an "Army Detachment of Belgium" under d'Urbal, shortly to become the VIII. Army. The instructions given to d'Urbal were that he should assume the offensive as soon as possible from his detaining points in the general direction Roulers-Thorout-Ghistelles, while the British on his right advanced on Courtrai and Menin, and the Belgians on his left along the coast. It was hoped by these means to separate the enemy forces, which were following up the Belgians retiring from Antwerp, from the main body of the German army, and hem them in along the coast, and then to push forward against the right flank and rear of the German VI. Army S. of Lille.

Unfortunately it was found impossible in the event to carry out this far-reaching scheme. Not only was the Belgian army too weak and exhausted to be able to take part in an offensive without a breathing space for rest and refitment, but the first troops of the French VIII. Army only became available on Oct. 23; and by that time the situation had radically altered. It became evident that, so far from being in a position to drive back the enemy, the Allied forces were outnumbered and would do well if they could even hold their own. Consequently, although the idea of an Allied offensive was never entirely abandoned, the necessity for using the various formations as they arrived prevented it from being effectively put into execution.

The First Stages of the Battle of the Yser.—The detrainment of the German IV. Army was completed on the 13th, and its units, moving forward at once, had reached by the 17th the area Bruges-Thielt-E. of Courtrai. The III. Reserve Corps pushing eastward in front of the army, with its right along the coast and its left on Roulers, screened the advance of the newly arrived Reserve Corps. It was then ordered to clear the front by closing up on its right, which had on the 15th entered Ostend. On Oct. 16 it came into contact with the Belgian cavalry and forward posts E. of the Yser, and after two days of desultory fighting forced them to withdraw to their main position.

On the 18th the first encounters took place between the main bodies of the Belgian 2nd, 1st and 4th Divs., holding the Yser line from Dixmude to the sea, and the German III. Reserve Corps, which had been ordered to reach the neighbourhood of Furnes. The advancing Germans early came into contact with the Belgian outpost positions on the E. bank of the river on the line Lombartzyde-Mannekensveere-Schoor-Keyem. The northern part of this line held fast against repeated attacks but by nightfall the Germans had taken Schoor and Keyem; the latter however was recovered during the night. The attacks were renewed next day; the German XXII. Reserve Corps, coming into line to the S. of the III. Reserve, moved against the French and Belgian positions around Dixmude. Keyem and Beerst fell into its hands early in the day; Beerst was retaken about noon by the Belgian 5th Div. and the French Fusilier Marines, who were however forced to fall back in the evening to their former positions owing to the approach of further strong hostile forces (the XXIII. Reserve Corps) astride the railway from Thorout. On this flank the Allied units were now withdrawn behind the Yser, with the exception of the garrison of Dixmude. Preparatory fighting continued on the 20th on both flanks. The II. Reserve Corps, reinforced by the 4th Ersatz Div., moved forward and carried Lombartzyde in the N. while to the S. a combined attack of the XXII. and XXIII. Reserve Corps in the morning was repulsed with heavy loss by the French forces holding Dixmude.

The German IV. Army was now completely deployed against the Yser line. The 4th Ersatz Div. in front of Nieupoort, the III. Reserve Corps thence to Keyem, the XXII. Reserve Corps around Beerst and the XXIII. Reserve Corps E. and S.E. of Dixmude, in all seven divisions with over 400 guns, were aligned in face of the five Belgian divisions with their 350 guns. On the 21st, after a violent bombardment lasting throughout the night, the Germans advanced all along the line, their young troops fighting with the greatest courage but meeting with little success; and the French and Belgians, at the price of serious losses, held their ground at all points. In the night, however, the III. Reserve Corps succeeded in throwing a temporary bridge over the Yser, in the bend N. of Tervaele, and in passing over to the western bank infantry and machine-guns, while their artillery were brought close up to the stream to cover the advance of strong reinforcements. The 1st Belgian Div.'s counter-attacks failed to retrieve the situation; the Germans not only held their ground but extended it during the 23rd by seizing Tervaele itself to the S. The Belgian 3rd Div. was thrown into action from general reserve, without effecting more than the temporary checking of the hostile advance; during the day, the French 42nd Div., which had carried out a successful counter-attack on the 23rd to the E. of Nieupoort, was placed at the disposal of the Belgian Higher Command and transferred near Tervaele, with the object of striking into the southern flank of the German troops who had crossed the Yser.

The French counter-offensive in the centre, supported as it was by all the available units of the Belgian 4th Div., though it failed to throw back over the river the two battalions of the III. Reserve Corps which held the Tervaele bridgehead, was successful in checking any further progress on their part. By the evening of the 24th indeed, both sides were showing signs of exhaustion. The efforts of the 4th Ersatz Div. before Nieupoort and those of the XXII. Reserve Corps before Dixmude had met with no success; despite the powerful artillery fire from the heavy German artillery, which had reduced Dixmude to ruins, the Fusilier Marines still held the town, repulsing on the 24th 15 successive attacks. The Belgian army, however, had bought its success at the price of the severest losses; over 25% of its combatant strength had been placed *hors de combat*, and only 180 guns with only from 160 to 190 rounds apiece were left fit for service. The situation appeared to the Belgian Higher Command to demand extreme measures; it was doubtful if their troops could withstand another series of assaults such as those which had just been delivered, and on the 25th it was decided (it is said on the suggestion of Foch) to open the sluices of the Yser and inundate the country E. of the Nieupoort-Dixmude railway. The sluices of Nieupoort were opened at 4 P.M. on that day, under cover of darkness; the line of defence in the centre was withdrawn to the railway embankment, which it was intended to hold during the few days that must elapse before the slowly moving waters, fed by the successive tides, should engulf the country to the E. and form an impassable barrier.

Before recounting the last German assaults on the Yser front, we must return to the British sector, to the south.

First Stages of the Battle of Ypres.—The presence of the new German IV. Army in his front, and in particular the approach of the fresh Reserve Corps toward the gap at present open between himself and the Belgians, was at this date (the 15th) unsuspected by Field-Marshal Sir John French, whose attention and energies were concentrated on the offensive which he had arranged to carry out in conjunction with the Allied forces to his right and left in the direction of Courtrai and Menin. His instructions to his corps commanders were that the advance should be continued during the next few days on the whole front, the II. Corps on the right advancing due E., the III. Corps in touch with it securing the Lys crossings from Sailly to Armentières, and the cavalry passing over the river at Menin and advancing N.E., while Rawlinson with the IV. Corps on the extreme left moved on and to the N. of Courtrai. The last-named was warned to watch his left, beyond which hostile detachments were reported near Bruges and Roulers.

YPRES AND THE YSER, BATTLES OF 1914
PLATE I.

These operations, undertaken on the 15th and 16th, had hardly begun before it became evident that their continuance on the original lines was no longer warranted by the situation. The resistance met by the IV. Corps on the line Houthem-Gheluvelt-St. Julien-Westroosebeke convinced French that it was indispensable first to clear the hostile forces from the area N. of his left flank. Foch, however, on being asked to assist in this, could promise no more troops before the 22nd at the earliest, as his forces were still assembling. Accordingly, the IV. Corps was ordered to push on along to Menin on the 18th, the 3rd Cav. Div. screening its left, in conjunction with de Mitry's French Cav. Corps, which had come into line on the previous day W. of Houthulst forest. This task Rawlinson felt himself unable to carry out owing to the advance of strong hostile columns, consisting of the XXVI. and XXVII. Reserve Corps, against his left S. of Roulers, and by the evening of the 19th he had fallen back to the line Kruiseik-Zonnebeke.

On the same day the concentration of the I. British Corps in the N. was completed in the area Poperinghe-St. Omer. French had now given up his ideas as to the possibilities of an Allied offensive and, realizing he was face to face with strong hostile forces which were being rapidly reinforced, began to fear for the weakness of his long and thinly held line, reserves for which were lacking. Although the II. and III. Corps were fighting against powerful positions and had been heavily taxed, French considered that the danger was greatest in the N., where the IV. Corps was holding altogether too extended a front, and that a break through there, while less fatal in its results than a similar disaster in the S., was inevitable unless reinforcements were sent at once. Accordingly the I. Corps was sent N. with orders to advance on Thourout with the object of capturing Bruges, if possible, before the enemy reinforcements, now believed to be in movement across Belgium, could be brought into line. French, however, was not too confident that this would prove feasible, and his instructions to Haig therefore envisaged not only the further prosecution of an eventual success toward Ghent, but also the possibility of the I. Corps having to go to the help of the IV., if the latter were heavily attacked.

Meanwhile the II. and III. Corps and the cavalry were ordered to confine themselves to the defensive, in view of the hostile superiority in their front.

The I. Corps only came into line to the S. of the IV. Corps on the 21st and by that date the advance of this latter toward Menin had, as we have related, come to an end; the 3rd Cav. Div. and de Mitry's horsemen to the N. had also been forced back, while the British Cav. Corps had retired to the Messines-Wytschaete line. To the S. Conneau's French cavalry were in line between the British II. and III. Corps.

It was only on Oct. 21 that the full extent of the menace to the British front burst on French, to use his own words, "like a veritable bolt from the blue." He at once realized that, in face of this overwhelming hostile superiority, all hope of a successful British offensive must be given up and indeed that he might have serious difficulty in maintaining his present positions. The British situation was certainly no easy one, for at the moment all available troops were in line, and the only reserves and reinforcements that seemed likely to be available for some weeks consisted of the Indian Corps, one division of which had just detrained W. of Hazebrouck, two Territorial battalions, and one cavalry and two yeomanry regiments.

Fortunately, French reserves were being hurried up from the S. The first of them, the IX. Corps, began to detrain in the Ypres area on the 23rd. During these three days from the 21st to the 23rd, when the British army was left to itself to withstand the shock of the enemy, it succeeded in holding its own without great difficulty. By the evening of the 21st the I. Corps had even commenced an advance, but the withdrawal of the French cavalry and Territorials on its left, which had been forced back by the advance-guard of the XXIII. Reserve Corps, compelled Haig to halt on the line Bixchoote-Langemarck-Zonnebeke. Here he held his ground against repeated attacks that night and all next day despite the wideness of his front;

and, though the positions of the 1st Div. were broken into N.W. of Langemarck late on the 22nd, counter-attacks held up the German advance and finally on the 23rd recovered practically all the lost ground. Meanwhile the rest of the 1st Div. line held its positions against the attacks of the XXIII. Reserve Corps until the evening of the 23rd, when the 2nd Div. was relieved by the newly arrived troops of the French IX. Corps; 24 hours later the 1st Div.'s place was taken by French territorials.

The 7th Div. on the front Zandvoorde-Zonnebeke had also had heavy fighting to do from the 20th onward. The German XXVI. and XXVII. Corps, despite some success against the French on Rawlinson's left, which compelled him to retire that flank somewhat, were unable to make any impression on his front until the 24th, when units of the XXVII. Reserve Corps forced their way into Polygon wood and had to be ejected by the reserves of the 7th, assisted by units of the 2nd Division.

By this time the French Command considered that the time had come to undertake a general offensive. The French IX. Corps had just come into line and the XVI. Corps was on its way northwards. The British 2nd Div. was also available and was ordered to coöperate, as were also de Mitry's cavalry from Bixchoote and the French 42nd Div. along the coast from Nieuport. As a matter of fact the moment chosen was favourable from factors which the Allied leaders could not be aware of. The Germans were suffering from a local shortage of munitions; their new troops had suffered heavily, thanks to their enthusiasm untempered by training and experience and had everywhere been brought to a halt before the Allied lines. But the odds against the attack proved too great. The French IX. Corps and the 2nd Div. to its right made little progress on the 24th, despite their valiant efforts, and the offensive gradually petered out, not without taking heavy toll of the Germans, on the line N. and E. of Langemarck-W. of Poelkapelle, Paschendaale, and Moorslede. The 7th Div. on its front had only been able to hold its ground, and, in view of its weakness after three weeks of incessant marching and fighting, was on the 27th put under the I. Corps, together with the 3rd Cav. Div.; at the same time Haig's two other divisions were again put into line. The right of the 7th was now at Zandvoorde, that of the 1st on the Menin road, that of the 2nd just in Polygon wood.

To the S. of the I. Corps the 2nd Cav. Div. on the 20th held the front from Hollebeke to Messines; the 1st Cav. Div. extending thence to St. Yves; the 3rd Cav. Div. came into line later on the left of the 2nd and three Indian battalions were moved to Wulverghem in support. This part of the front, despite repeated attacks by the German XIX. Corps, remained intact till the 30th. On the right of the cavalry the II. and III. Corps also succeeded in maintaining their general line.

By the evening of the 27th the German IV. Army had been brought to a standstill on the whole front. "The XXVI. and XXVII. Reserve Corps were by this time" (Oct. 24), says the German official account, "completely held up in front of strongly entrenched positions on line Langemarck-Zonnebeke-Gheluvelt. . . . For the time being any further thought of a break-through was out of the question," and the decision which appeared at the moment to be "imminent" on the Belgian front near the coast had not yet been achieved. To assist the efforts of their comrades in this sector, and to cover the bringing up of further reinforcements to drive home the attack against the British line, the XXIII., XXVI. and XXVII. Reserve Corps were urged on to deliver holding attacks on their front. Despite their courage and persistence, the Germans, however, not only failed to make headway but were compelled in places to give back before the Allied counter blows; their only gain was registered at Kruiseik, which was wrested from the 7th Div. on the 28th after to and fro fighting. To the S. also the enemy pressed heavily against the front held by the British II. and III. Corps, assisted from the 23rd onward by a brigade of the Lahore Div. which relieved Conneau's Cav. Here the XIX. and VII. Corps made some headway and by the 29th had pressed the British front back to the line Givenchy-W. of Neuve Chapelle-S.E. of Armentières-Messines, where the Cavalry

Corps' right rested. The fighting was bitter and bloody, so much so that on the 28th the II. Corps, much reduced, had to be relieved by the Indian Corps, under Willcocks.

Meanwhile the French XVI. Corps, which had detrained its leading division on the 26th, was sent forward to reinforce the French IX. Corps S. of Houthulst forest, in order to participate in a new advance in the direction of Roulers. This attack, carried out on the 28th, failed to make much progress, and in the evening the French VIII. Army's line, which was held from N. to S. by the 4th Cav. Div., the 80th and 87th Territorial Divs., the 5th and 7th Cav. Divs., the 31st Div. (XVI. Corps), the IX. Corps, and the 6th Cav. Div., ran from the Yser just above Dixmude by the W. and S. edges of Houthulst forest—W. of Poelkapelle and Passchendaele—to Becelaere. To the left this line connected with the French Marine Fusiliers at Dixmude; to the right with the British I. Corps. Despite the slight progress made on the 28th, d'Urbal's orders were still for the continuance of the offensive.

Final Stages of the Battle on the Yser, Oct. 26–Nov. 4.—We left the Belgians and French on the evening of the 25th, re-forming their lines behind the embankment of the Nieupoort–Dixmude railway, with orders to hold that line at all costs until the full effect of the inundation should make itself felt, and forbid any further German attacks. This could hardly be before the 31st, and meanwhile the III. and XXII. Reserve Corps were bringing up their artillery over the river, pushing forward patrols to occupy the ground up to the new Allied position, and making all preparations for a renewal of the attack. By the evening of the 29th these preparations were completed. Only one brigade of the 4th Ersatz Div. was left facing Nieupoort, the Marine Div. being brought forward to fill its place; the rest of the Ersatz Div. thus became available for the decisive attack against the Belgian centre. At 6:30 A.M. on the 30th this assault took place under cover of a violent bombardment. The first rush carried the Germans up to within a few yards of the railway embankment; bombing their way forward they swept over it and, taking the defenders enfilade, drove a wide gap in the Allied line from Ramskapelle to Pervyse, both of these villages falling into their hands. The Belgian 2nd Div. was broken through and the situation was critical in the extreme. A counter-attack by four French and Belgian battalions was immediately put in by Gen. Grosetti, commanding the French 42nd Div., and succeeded in holding up the enemy flood. A second counter-attack, delivered about 4 P.M., penetrated into Ramskapelle, where fighting continued to rage furiously all night. On the flanks of the attack the Allied line of defence had held fast, and the 4th Ersatz Div. and the XXII. Reserve Corps had been held up.

The crisis was past. The German intention was to renew the attack on the 31st, but at 11:30 P.M., as orders to this effect were being prepared, a staff officer from one of the divisions arrived at the headquarters of the III. Reserve Corps with the report that in view of the rise of the river the attack could not be continued. A belt of water 2,000–3,000 yd. wide and reaching as high as a man's waist covered the country behind the German front-line units and threatened to cut them off from their comrades unless they were hastily withdrawn. Accordingly, on the 31st the III. Reserve Corps was ordered back to the E. bank of the river, only weak rear parties being left to cover the movement. By 9 A.M. the Belgians were once more in possession of Ramskapelle and the railway embankment. Farther to the S. the positions held by the XXII. Corps on the W. bank of the river N. of Dixmude were also menaced by the rising tide of water, and the troops holding them were withdrawn on the night of Nov. 1. By the morning of the 2nd there were left of all the German gains on the left bank of the Yser only the villages of Schoorbakke and St. Georges and two farms N. of Dixmude.

On either flank of the Allied line where bridgeheads existed over the river, the first days of Nov. saw a series of small attacks with the object of improving the local positions. Such operations took place on Nov. 3 and 4 in the Nieupoort sector, when Lombardzyk was occupied temporarily but lost again. A small attack also took place on the 3rd E. of Dixmude, and

others on the 4th against St. Georges and Schoorbakke, but generally speaking, the Germans maintained their positions.

The battle of the Yser, strictly speaking, was over, and the plan of the German Higher Command, to seize the Channel ports and envelop the Allied left flank, had failed thanks to the heroic resistance of the French and Belgian troops. It was estimated that the battle had cost the Belgian army 18,000 casualties, the French some 5,000 (inclusive of the action at Dixmude on Nov. 10), and the Germans some 28,000.

Crisis of the Battle of Ypres, Oct. 29–Nov. 8.—In conjunction with the decisive attacks on the Yser line in the N., the German IV. Army was also preparing for a renewal of the assault on the Ypres front. A new army group was formed, under the command of von Fabeck, consisting of the Bavarian II. and the XV. Corps and the Bavarian 6th Reserve and 26th Div., with some heavy artillery from the VI. Army. This new group, assembling behind the junction of the IV. and VI. Armies, was to come into line on the 28th on the front Werwicq–Deulemont, in order to deliver a decisive attack also on the 30th. Both the German armies already in line were to coöperate.

Their preparatory attacks commenced on the 29th with extreme vigour. The Bavarian 6th Reserve Div., which had preceded the remaining troops of the new group into the battle-line, under cover of the early morning mist drove in the 1st and 7th Divs. at their point of junction E. of Gheluvelt. The reserves of the former division threw them back again out of all but the front trenches they had gained; the losses of the assailants were heavy. But this was only the prelude to the drama about to open. During the night of the 29th–30th the Fabeck group relieved part of the VI. Army Cav. in the line and went forward at 9 A.M. next morning. The XV. Corps on the right, moving with its right on the Menin–Ypres road and with its left on Zandvoorde, fell upon the 7th Div. and pushed them out of Zandvoorde after fierce fighting, but were then checked by the I. Corps reserves. On their left the Bavarian II. Corps advanced, and the French XVI. Corps and the British 3rd and 2nd Cav. Divs., after giving up some ground, made head against the enemy just E. of St. Eloi and Wytshaete. The 26th Inf. Div. failed however to dislodge the 1st Cav. Div. from Messines; a temporary success by the I. and II. Cav. Corps E. of Ploegsteert wood was retrieved by the 4th Div., and the XIX. Corps also failed to hold their gains at Bois Grenier, against the 6th Div.

The situation of the British, despite the fact that they had for the moment held their front intact, gave rise naturally to considerable anxiety at French's headquarters and the promise of Foch, who visited French at 2 A.M. on the next morning, to dispatch strong reinforcements to the I. Corps on the morrow, must have been very welcome. It was agreed that a French force of five battalions and three batteries under Moussy should be put in near Hollebeke, and another detachment at Becelaere; while the 32nd Div. would be sent to support the cavalry astride the Ypres–Comines canal. Before these forces could be brought up on the 31st, the enemy renewed his assaults. The 4th Div. in the S. was first attacked shortly after dawn; the action soon spread to the N., where the 26th Inf. Div. strove with the British Cav. Corps for the possession of Messines. The village was lost at 9 A.M., re-entered at 1 P.M., disputed hotly till dark and finally left in British hands. Farther to the N. the Bavarian 6th Reserve Div. vainly assailed the front of the 2nd and 3rd Cav. Divs., whose sector was taken over before long by the French XVI. Corps; but though the latter on their part delivered a series of counter-attacks, they were unable to achieve much.

The main crisis of the battle, however, was played out N. of the Ypres–Comines canal. Here the Bavarian II. and the XV. Corps had, as early as 10:30 A.M., forced back the 1st Div. front N. of the Menin road and followed this up by a strong attack along the road itself. Eight battalions employed against Gheluvelt quickly overmastered the two battalions in garrison there, and by 1:30 P.M. had seized the village and driven a gap in the British line. The situation was perilous in the extreme; the left of the 7th Div. was enveloped, and the right of the 1st Div. forced back in disorder down the Menin road. At the same time

the commanders and some of the staff of the 1st and 2nd Divs. were knocked out by a shell which struck their headquarters; Haig prepared to retire to a line just in front of Ypres and hold on there at all costs.

But the Germans could not exploit their success; the Worcesters, in local reserve, thrown in at 2 P.M., checked the enemy's progress, and secured a position from which they could flank any further advance beyond Gheluvelt. The left of the XV. Corps had been held up by the 7th Div., assisted by the local reserves, and had been unable to exploit the exposure of its immediate enemy's flank caused by the loss of Gheluvelt. The Bavarian II. Corps indeed forced its way forward somewhat against the right of the 7th Div. and the 3rd Cav. Div., but its advance also eventually came to a stand, as had that of its comrades on the right and left of it. A gap which opened in the right wing of the 7th Div. late in the afternoon was opportunely filled by the arrival of the 7th Cav. Bde. which threw back the enemy.

It was clear that the enemy would not desist from his efforts, which had on the 31st brought him so near to success, but that further fierce attacks might be anticipated on the following days. The situation seemed therefore dark enough; the troops of the French VIII. Army, with which it had been intended to assume a large scale counter-offensive against both flanks of the enemy group attacking the British I. Corps, had had to be thrown in piecemeal to support various weak points in the line, and only one division, the 43rd, was left in general reserve W. of Ypres. Certain units even of this division had been sent into line before nightfall on the 31st in the vicinity of St. Eloi.

The fighting on Nov. 1, as was expected, was little if at all less severe than on the two preceding days. The main pressure, however, had shifted from the front of the British I. Corps over the Ypres-Comines canal to that of the cavalry corps. In the N. the enemy's efforts, which were not very vigorous, broke down before the readjusted lines of the 1st and 7th Divs., and the 3rd Cav. Div. The fighting, which had continued all through the night of the 31st-1st around Wytschaete and Messines, had already placed the cavalry corps in a difficult position, their line being broken at several points, and only partly reestablished; however, the main German attack did not take place till noon, when the Bavarian 6th Reserve Div. and the 26th Div. advanced. Wytschaete, lost between 2 and 3 A.M. on the 31st, was still at this time in German hands, despite the efforts of reinforcements from the 3rd Div., sent up from the S. and from the 5th Cav. Bde. with French units of the 32nd and 43rd Divs., but the village was recovered about 6 P.M. and held firmly by the French. The loss of Wytschaete had been followed by that of Messines; the 1st Cav. Div. were drawn back to an entrenched line N. of Wulverghem, and later relieved by parts of the French XVI. and XX. Corps and of Conneau's cavalry. The situation, which had at one time seemed critical, was thus saved by the arrival of French and British reinforcements, and by the evening gave rise to less anxiety. The attack was continued next day by the Germans, who had put in a new division, the 3rd, on the left of the Bavarian 6th Reserve, and the fight swayed to and fro all day. By the evening Wytschaete and the crest of the ridge had been lost, but the French line was firmly settled on the rear slopes of the ridge to the west.

Gen. d'Urbal had not yet however abandoned all hope of a successful offensive, but the attempts of the French to advance on the 2nd and following days were neutralized by renewed efforts on the part of the enemy, and only in the Merckem-Bixchoote area was some slight progress made. On Nov. 5 d'Urbal received instructions from Joffre, which stated that the Flanders theatre of operations had lost some of its importance since neither Allied nor German attacks could hope to gain any further appreciable result, and that it was intended shortly to withdraw troops from the VIII. Army for use elsewhere.

Meanwhile the British dispositions had undergone some changes; the 7th Div. being relieved by two composite brigades from the II. Corps, and the French IX. Corps taking over part of the I. Corps front.

A renewed period of activity on the British front occurred in a few days, when these reliefs had been barely completed. On the 6th and 7th the 7th Cav. Bde. and units of the 7th and 1st Divs. recovered some ground lost by the French near Zwartelen; attacks on the 7th and 8th against the 3rd Div. E. of Herenthage wood and the 1st Div. and the French farther N. were also successfully dealt with. This was but the muttering before the bursting of the last storm.

The Germans, determined to make one last push for Ypres, formed on the 9th a new army group under von Linsingen, consisting of the XV. Corps and a composite corps, made up of the 4th Div. and a division of the Guard. This was put in on the left of the Fabek group with orders to drive back and crush the enemy N. of the Ypres-Comines canal. The Fabek group was to coöperate with infantry and artillery. This attack, timed for the 11th, was to be prefaced by an advance of the whole IV. Army on the previous day from Dixmude S. to Polygon wood. The southern part of this attack however did not get going.

The Final Battle, and the Stabilization of the Flanders Front, Nov. 8-20.—The attack on Dixmude was entrusted to the 4th Ersatz Div. and the XXII. Reserve Corps and took place on Nov. 10. The garrison of Belgian infantry and French Marine Fusiliers had been reinforced by French colonial troops and the Germans had to pay dearly for their success. The bombardment opened at dawn and the infantry attack at 7:40 A.M. It failed and was renewed after further artillery preparation at 9:30 A.M. By 1 P.M. the garrison had been driven from the eastern suburb and the town was assailed from N.E., E., and S.E. After desperate fighting, lasting till nightfall, the Germans succeeded in securing possession of the ruins of Dixmude. The garrison withdrew to the W. bank of the Yser and broke the bridges, but the enemy made only half-hearted attempts to follow them. They claimed to have taken in the town about 1,400 prisoners and much material. Further to the S., in the Bixchoote-Langemarck area, the German attacks made little headway. The British front was not attacked on the 10th.

Its turn was to come on the 11th, when the Fabek and Linsingen groups attacked on the whole front from the Menin road to S. of Messines, about 9:30 in the morning, after two hours' bombardment. A thick mist veiled and assisted their advance. On the right of the assault the 12 battalions of the Guard struck against the line held by the weakened British 1st and 9th Bdes., and some French Zouaves. Their right broke past the S. side of Polygon wood, and swept the defenders out of Nonne Boschen, but their further progress was stayed on the western edge of this copse, and shortly after noon a counter-attack by the 2nd Oxon. and Bucks. L.I. forced them out of it again. The centre and left of the Guard, after some initial success in Inverness copse and Herenthage wood, were also held up and compelled to abandon most of their guns. Further S. also little progress had rewarded the Germans' efforts. The XV. Corps had to content itself with the capture of Hill 60; the Bavarian II. Corps gained some success N. of Wytschaete; elsewhere the attackers had been kept to their trenches.

This day's fighting was the closing act of the Ypres battle. Both sides were entirely exhausted by close on a month of sustained and bitter fighting, which had thinned their ranks, drained their supply of munitions, and left them no available reserves which could be employed in further effort. On Nov. 15 General d'Urbal came to the decision to suspend further offensive activity, consolidate his position and allow his troops a period for rest and refitment. Joffre, however, felt that the operations on the Flanders front had reached their fitting termination with the repulse of the enemy's last desperate effort to bring about a decision in the open field; and accordingly instructed d'Urbal to hold himself henceforward on the defensive.

The Germans on their side had also come to an end of their resources. On the 17th the German IV. Army commander, after the failure of a final effort by the 4th Div. in Herenthage wood, "decided to give up any idea of continuing the offensive—a decision to which he was compelled by the low fighting strength

YPRES AND THE YSER, BATTLES OF

of his troops and the bad autumn weather which was affecting their health; . . . the German General Staff fully concurred in the decision."

Meanwhile on the 21st the British were withdrawn from the Ypres salient. French troops took over the front line; the I. Corps and Cavalry Corps remained in reserve; the two brigades of the II. Corps which had been sent up to the N. were also moved back to rest.

The battle of Flanders was at an end, and the armies, their front stabilized along all the line from the sea to Switzerland, settled down with the approach of winter to trench warfare.

(X.)

II. BATTLES N. OF THE LYS, 1915

The five weeks' pause in active operations which had followed the battle of Neuve Chapelle was due mainly to the necessity of accumulating ammunition, of which the supply was still far from adequate, but also to the need of timing the next attack to coincide with General Foch's great attack against the Germans N. of Arras. Meanwhile a minor operation carried out by the II. Corps S.E. of Ypres led to extremely fierce local fighting. Where the Ypres-Comines railway cuts through one of the southern spurs of the Broodseinde ridge there is a mound which was of considerable tactical value especially as an artillery observation post. On April 17 1915 this "Hill 60" was successfully stormed by the 2nd K.O.S.B. and 1st Royal West Kents of the 5th Div., but its capture provoked prolonged and vigorous counter-attacks. The hill was lost and retaken more than once and not only the whole of the 13th Bde. but the 1st Devons and 1st E. Surreys of the 14th Bde. and the 2nd Camerons of the 27th Div. had to be thrown into the fight. By the end of a week the Germans had apparently acquiesced in the loss of the position for their counter-attacks died away.

But the struggle for Hill 60 was soon to be eclipsed. During April the British had gradually relieved the French in the Ypres salient. First the 27th Div. took over the line from Zwartelen to Polygon Wood, then the 28th came in on the left to and beyond the Broodseinde cross-roads, by April 17 the Canadian Div., now allotted to the V. Corps, occupied the N.E. face of the salient as far as the Ypres-Poelkapelle road. Thence to the Ypres-Yser canal were French troops, chiefly Africans. It was against this last section that on April 22 the Germans delivered the first gas attack. Some suspicions of this new weapon seem to have reached the Allied Headquarters, but there had been no time for preventive measures, and to the unfortunate Africans the gas-clouds came as a complete surprise. Luckily for the Allies the efficacy of their new weapon surprised the Germans themselves: they hastened to fall upon the Canadians whose left flank the rout of the French had completely exposed, but they had not enough troops to exploit their success.

The Canadians stood the strain of their first serious engagement splendidly. Their front line maintained their positions unshaken; a line was hastily improvised along the Poelkapelle road toward St. Julien to cover the exposed flank and rear of the front line, while local reserves manned the second-line trenches near "Shell Trap Farm" N. of Wietje in time to check the further advance of the Germans. Divisional and corps reserves were hurried up at once and that evening a counter-attack by the 10th and 16th Batts. temporarily recovered a wood W. of St. Julien. But the position was critical in the extreme. Between "Shell Trap Farm" and the canal a 2-m. gap lay open, Ypres itself was dangerously exposed and all the troops in the salient might have been cut off by a rapid German advance in force. Moreover, during the night of April 22-23 the Germans succeeded in capturing the bridge at Steenstraete over the Yser canal and established themselves on the western bank.

The first need was therefore to close the gap between the Canadians and the French right. But conditions were all against counter-attacks. There was little time for reconnoitring or for coordinating advances, there was hardly any heavy artillery to smash them for over 50 French guns had fallen into the enemy's hands. In the course of April 23 attacks were made

by a detachment drawn from the reserves of the 28th Div. by the Canadian 1st and 4th Batts. and by the 13th Bde. (5th Div.) hastily fetched up from the rest camp where it was recuperating after its heavy fighting for Hill 60. These attacks did not dislodge the Germans from the position they had already dug and wired along the ridge running westward past Pilckem, but they prevented further advance and by the evening a continuous line had been established from the canal to St. Julien. Elsewhere the position remained unchanged; though heavily shelled and under reverse and enfilade fire the Canadians stuck stubbornly both to their original trenches and to the new flank thrown back to cover St. Julien, and more than one German advance was beaten off.

But with the Germans on the Pilckem ridge their guns could not only enfilade all the roads leading eastward into the "Salient" but could fire into the backs of the troops S. and E. of Ypres whose situation was therefore rendered most unsatisfactory. However, encouraged by promises of large French reinforcements, Sir John French endeavoured to maintain his original position until the French could reestablish theirs. He had brought up a brigade of the 4th Div. and the newly arrived Northumbrian Territorial Div. (later numbered 30th), while in the course of April 24 the Lahore Div. reached Ouderdom. But before a systematic counter-attack could be launched a successful German attack on the Canadians had changed the position for the worse. On the morning of April 24 an extremely heavy bombardment developed on the original Canadian trenches, followed by the discharge of gas and by infantry attacks in force. The troops N. of St. Julien were overwhelmed and in the course of the morning the Germans, pressing on, made themselves masters of St. Julien and drove its defenders back upon Fortuin. Between Fortuin and the trenches of the Canadian 2nd Bde., which still held out, there was for a time an open gap, but the German efforts to advance were checked by artillery fire at short range and before dark the gap was filled mainly by units of the 28th Div. to whose position, around Broodseinde, the German attacks had now extended though without success. But St. Julien was gone and the next counter-attack had to make the recovery of St. Julien its objective.

This, delivered early on April 25 by the 10th Bde. and various attached units, advanced the line a little, but failed to recover the village. With equal gallantry and equally heavy casualties the Lahore Div. and the French attempted on April 26 to regain the Pilckem ridge, but just as success seemed within reach gas drove the French back and the advanced troops of the Lahore Div., overcome by this new weapon, could not maintain the positions they had reached. The Northumberland Fusilier (T.F.) Bde. attacked St. Julien with the same ill-fortune and meanwhile the Germans had managed despite the stubborn resistance of the Canadian 2nd Bde. to capture most of the Gravenstafel ridge. The 28th Div.'s left, N. of Broodseinde, was thus seriously exposed while simultaneously its infantry attacked it in front, but the arrival of the 11th Bde. (4th Div.) enabled some sort of line to be established across the N. of "the Salient." Still it was only with great difficulty and heavy losses from shell-fire, that the newly arrived units managed to dig themselves in and establish touch with each other. Luckily the German infantry attacks lacked vigour and determination and afforded the defenders welcome opportunities for retaliation.

By the evening of April 26th, however, the situation had not improved. A second attempt by the Lahore Div. (April 27), though gallantly pressed, achieved nothing; the French had made no progress and with the Pilckem ridge firmly held by the Germans the advanced position of the V. Corps was clearly untenable. Accordingly Sir John French decided upon a withdrawal to a new line running N. of St. Jean, N.E. of Wietje, by Prezenberg, E. of Hooze, through the woods S. of the Ypres-Menin road to join the original line of the V. Corps N. of Hill 60. This line was much less liable to reverse and enfilade fire, but the evacuation of the Broodseinde ridge and Polygon Wood meant losing valuable positions only to be recaptured at a heavy cost in the autumn of 1917. The new

YPRES AND THE YSER, BATTLES OF (1914)

PLATE II.

was, however, postponed to allow the French and the Lahore Div. one more attempt upon the Pilckem ridge but this also achieved nothing substantial and was followed by renewed German attacks and desperate fighting. On May 1 an attempt upon Hill 60 in which gas was effectively used was only just beaten off by the gallantry and steadiness of the 1st Dorsets. Next day a violent attack was launched against the northern face of the salient from St. Julien to the canal, bearing hardest upon the 12th Bde., who suffered terribly from the gas. Prompt counter-attacks by the local reserves, including dismounted troopers of the 3rd Cav. Bde., restored the situation and drove the Germans back with heavy losses while elsewhere the line was successfully maintained. The actual withdrawal, begun on the night of May 2-3 and completed on May 4, was covered by a stubborn defence of the left of 28th Div.'s line N. of Broodseinde by the 2nd Buffs and the 3rd Royal Fusiliers, thanks to which the final stages of the retirement were unmolested by the Germans, who did not indeed discover what was happening until too late to interfere. Their one substantial success was the recovery of Hill 60, recaptured on May 5 by a renewed gas attack.

The evacuation of the advanced position of the V. Corps may be taken as ending the first stage of the battle. Fighting continued, however, for another three weeks during which the Germans delivered three major attacks, on May 8, May 13 and May 24. The first of these broke through the 28th Div. near Frezenberg and resulted despite several counter-attacks in the loss of most of that division's front line, though on its left the 4th Div., which had replaced the Canadians, maintained its position. Between May 8 and May 13 there was particularly bitter fighting round Hooze where the 27th Div. was posted astride the Menin road. After repeated attacks the Germans contrived to make a few lodgments in the line, but their advances in mass formation had given good targets and they lost heavily, more than one local counter-attack meeting with success. South of the road against the 81st Bde. they gained nothing substantial, though N. of it the front trenches had to be evacuated in favour of a line just W. of the Bellewarde wood. The attack of May 13 extended from Hooze to the left of the British line. The exhausted infantry of the 28th Div. had now been relieved by the 1st and 2nd Cav. Divs. acting as infantry on whom fell the brunt of the exceedingly heavy bombardment. This was followed up by infantry attacks which had little difficulty in occupying positions which had been almost obliterated. Counter-attacks by the 7th and 8th Cav. Bdes. (1st and 2nd Life Guards, Royal Horse Guards, 10th Hussars and Essex and Leicester Yeomanry) reached the front line only to be forced back again by the violence of the bombardment, and the day resulted in the establishment of a new line some distance in rear of the original position, while the hamlet of Valorenhoek passed into German keeping and the left of the troops in the Bellewarde position had to be flung back to connect up with the cavalry's new line. On the other flank, however, in front of Wieltje the 4th Div. held firm and inflicted heavy losses on the enemy, retaking such portions of the line as the Germans had temporarily captured.

After May 13 ten days of intermittent heavy shelling and occasional sharp local fighting followed, during which the French recovered Streenstraete and thrust the Germans back across the canal. But the Germans had not finished. Early on May 24 a tremendous bombardment opened upon the whole front from the Menin road, northward. Gas was discharged in great quantities and at certain places, notably Hooze, "Shell Trap Farm" and the Bellewarde ridge, the defenders were completely overcome by the fumes. The Germans therefore had only to advance against positions practically denuded of defenders. Counter-attacks were launched, but without much success beyond preventing the Germans from penetrating deeper than the front line, while just S. of Hooze the determined resistance of the 1st Cav. Div. checked the extension of the German success. During the night of May 24-25 some units of the 27th and 28th Divs., hastily recalled from rest camps where they were seeking to assimilate the large drafts with which they had just been replenished, were put in to try another counter-attack. This,

however, failed to recover Hooze or the Bellewarde ridge, and similarly, though the 4th Div. maintained most of its front, its centre had to be retired to a new line through Wieltje.

This fighting, however, marked the last serious German effort on this front. With all the advantages of surprise derived from their use of gas, they had not succeeded in taking Ypres and if they had made substantial gains of ground and had inflicted heavy casualties on the defenders their own losses whenever they had ventured on an infantry advance had been heavy. When viewed as a whole the defence of the Ypres salient during April and May 1915 stands out as a splendid achievement. Many battalions were in the front trenches for three weeks and more on end, without any relief, constantly shelled, subjected to repeated attacks, at a fearful disadvantage in having to face gas-attacks with only the most inadequate and improvised protection. Ground was lost, but the main position was held and the II. Army's tenacious resistance supplies a good example of "economy of forces." When the German attack on Ypres was launched the Allied offensive further S. was about to be resumed. The II. Army was asked to maintain its ground without depending upon the men and munitions needed elsewhere. Only one division of the I. Army was employed in the defence of Ypres and it was not because of any diversion of resources to the Ypres area that the British offensive of May 1915 proved a bitter disappointment.

(C. T. A.)

III. BATTLES OF 1917

Continuous fighting of a violent character took place in the Ypres-Yser region during many weeks in the summer and autumn of 1917, but the operations as a whole may be said to have consisted of two distinct phases. The undertaking started with the brilliantly successful combat lasting only a few hours which has come to be known as the Battle of Messines. There followed a period of comparative lull, although progress was made at some points and although counter-attacks had to be beaten off. Then there were launched immediately to the N. of the scene of the Messines combat a series of attacks at short intervals which gained ground as successive waves do on a rising tide and which lasted for more than four months.

The object in view throughout was the occupation of the whole of the belt of high ground which extends from a point about three miles directly N. of Armentières to near Dixmude, beyond the forest of Houthulst. Its general direction is at first north-eastward to about Gheluvelt, then it turns northward to near Staden, and from that point it veers back westward toward the Yser, N. of the above-named forest. A continuation of somewhat more conspicuous high ground lying N. of Hazebrouck and Bailleul, this belt represents the watershed between the basins of the Lys and of the Yser. It rises generally some 100 to 150 ft. above the great Flanders plain, and it reaches a height of over 200 feet at a few points. Its southern portion in the spring of 1917 inclosed to a great extent the Ypres salient and had been the scene of many desperate encounters during the Ypres-Yser battles of 1914 and 1915; here the Allies' trenches gave them possession of some of the lower slopes on their side of the high ground, although all the upper portion was in German hands. Further to the N. the enemy held the whole of the high ground as well as stretches of plain to the W. of it, as from opposite Gheluvelt the direction of the Allies' front ran north-westward, i.e. diverging from the line of heights. The general plan of operations was to begin at the southern end, where the belt of high ground was almost contiguous with the British front, and to work from thence northward. This procedure was indeed almost dictated by the fact that the Ypres salient would have to be extended outward ere full use could be made in later undertakings of the important communications which diverge from Ypres itself toward Bruges and Ghent and Oudenarde. The capture of the line of high ground—its total length was about 23 m.—only represented the first part of the general strategical plan, which contemplated the initiating of subsequent operations in the coast district by another force.

YPRES AND THE YSER, BATTLES OF

The line which the Allies had been holding to the N. of Armentières since the spring of 1915 formed in plan an inverted letter "S," the lower loop turned to the W., the upper loop turned to the E. and creating the Ypres salient. The lower loop on the other hand represented a pronounced enemy salient jutting into the territory in occupation of the Allies and causing them great inconvenience. Its area consisted almost entirely of high ground which had come to be known as the Messines-Wytschaete ridge. From this dominating position the Germans effectively enfiladed, and to some extent took in reverse, the Allies' trenches to the S. and to the N. of the salient and also commanded the communications leading up to these from the rear, while they overlooked the town of Ypres from within easy field-gun range. Quite apart from any projects for an offensive on a great scale, the filling in of this enemy salient—the wresting of the Messines-Wytschaete ridge out of hostile hands—was bound to ameliorate the situation in Flanders from the point of view of the Entente and to render the task of barring the invader's way toward the Channel ports so much the easier. In framing his plans for the Flanders offensive Sir. D. Haig had already decided to make the high ground about Messines and Wytschaete his first objective months before the date when the attack upon the position, formidable by nature and rendered infinitely more formidable by the labour that had been expended upon it, actually took place.

General Plumer and his II. Army, who had been acting as the wardens of the Ypres front for more than two years, had been selected to carry this operation out. To enable the II. Army to bring its full force to bear, the V. Army under General Gough had been transferred from the positions which it had been occupying between the III. and IV. Armies in Artois during 1916, to the Ypres salient and it was thus on the left of the II. Preparations for the undertaking had been afoot since the previous summer but they had only been carried on in earnest during the preceding winter. Moreover all the necessary labour and material had not been available until the prior demands of the Arras scheme of offensive operations had been satisfied, and very strenuous work had consequently to be carried on up to the last moment so as to insure that all would be ready. The preparations included an elaborate railway scheme. Much road construction was an indispensable part of the plan. Special provision for securing an ample water supply had been made. A great force of artillery had been quietly assembled. But the most noteworthy item of all, owing to its virtual novelty, was the carrying into effect of arrangements for a deep mining offensive on a colossal scale. Twenty great mines had been established at the end of galleries running right under the enemy's front line of defence, but one of them had been blown up by the Germans; a total length of 8,000 yards of gallery had, in spite of very active countermining on the part of the enemy, been driven by the tunnelling companies of miners since Jan., and 600 tons of explosives had been distributed between the 19 mines that were effective. The simultaneous explosion of these mines at the moment when the assault was launched was, the most remarkable feature in a battle, the exceptionally decisive issue of which was primarily to be attributed to the labour that had been expended in advance, and to the care and forethought of commander and staff which had preceded the opening of the combat. It should be mentioned that the preparations above ground had been carried out under special difficulties owing to most of this area being overlooked from the German lines.

For the defence of this salient which they occupied, and the importance of which they fully realized, the Germans depended upon two separate sets of lines, coinciding in trace with its arc. The more advanced set of lines of the two was close to the trenches that were occupied by General Plumer's troops, and it was at most points pushed down the forward slope of the high ground. The second set of lines on the other hand, which formed an inner curve, followed the crest of the Messines-Wytschaete ridge along most of its extent. The villages of Messines and Wytschaete had been organized as main centres of resistance capable of offering a stout defence, and many farms, hamlets

and copses existing along the line had been utilized to form defensive posts. The Germans had moreover also constructed two chord positions stretching along the base of the salient partly on and partly below the reverse slopes of the high ground. The front one of these two positions represented the final objective given to the assaulting columns by General Plumer.

The troops of the II. Army detailed for the enterprise consisted, enumerating them from right to left, of the II. Anzac Corps under Lt.-Gen. Sir A. Godley (Australian 3rd Div., New Zealand Div., 25th Div.), with the Australian 4th Div. in support; the IX. Corps under Lt.-Gen. Hamilton-Gordon (36th Div., 16th Div., 19th Div.), with the 11th Div. in support; and the X. Corps under Lt.-Gen. Sir T. Morland (41st Div., 47th Div., 23rd Div.), with the 24th Div. in support. There were thus nine divisions in front line and three in support. As the final objective of the troops along the whole battle-front was the chord of the arc forming the salient, it followed that the divisions in the centre would have a greater distance to cover than the divisions on the flanks; this had been taken into account and had been provided for in the time-table. The moment of assault was fixed for 3:10 A.M. on the morning of June 7, and at that hour the 19 mines were exploded beneath the enemy's front line with devastating effect. At a number of points the hostile trenches were completely obliterated and their garrisons wiped out, so that when the assailants reached the enemy's front line under cover of a tremendous bombardment, very little resistance was offered and the first objective was secured almost at once. The consequence was that, as had been anticipated in the programme, the advancing infantry could proceed without delay to the execution of their next task, that of carrying the second German line. The capture of this proved more difficult than had that of the front defences. In some of the skilfully prepared localities the enemy detachments would not yield for some time, in spite of the storm of shell pouring down upon them; but such localities speedily became isolated as the assailants pushed on between them, and their fall was not then long delayed. The strongly fortified village of Messines was, according to the programme, taken by the New Zealanders. Wytschaete was captured after a determined struggle by portions of the 36th (Ulster) and of the 16th (Irish) Divs. fighting side by side. On the left, where a trough which is followed by the Ypres-Comines canal cuts through the belt of high ground, the 47th (London) Div. had very formidable obstacles to overcome but pressed steadily forward and took many prisoners. The movements of the attacking side had been somewhat hampered at the outset by the dim light and by the air being dust-laden owing to the great explosions; but as the morning wore on this impediment to advance disappeared. An interesting feature in the opening phase of the battle had been that the tanks told off to assist the advancing battalions had in many cases been unable to get up in time to share in the struggles for the German second line of defence, so rapid had been the movements of the infantry. The operations had proceeded in almost exact accordance with the time-table, and by early in the forenoon all the upper part of the Messines-Wytschaete ridge and of its extension north-eastward to the limit of the battlefield was in the hands of British and Australasian troops. These moreover had consolidated the ground that they had won, and they were holding a line which, along most of its extent, was on the reverse slope of the high ground and overlooked the German chord lines of trenches; guns had also been pushed forward promptly to assist at closer range the advance which was to be made against these as the final operations of the day.

This closing effort took place in the afternoon and it was completely successful, although the enemy showed some disposition to counter-attack and at some points offered a stubborn resistance. So it came about that by the evening the last objective had been fully attained, and that General Plumer and his army had placed an extraordinarily complete and decisive tactical success to their credit. The extent of the success was not to be measured merely by the importance and extent of the area of ground which had been wrested out of the enemy's

hands by masterly soldiery. Great captures in men and material had also been effected. 7,200 prisoners (including 145 officers) had been taken, together with 67 guns, 94 trench mortars and 294 machine-guns. Nor had the victory been purchased at a heavy cost in casualties. The total number of killed and wounded—the latter in many cases representing trifling injuries—only amounted to 16,000 in an army of sixteen divisions assailing a position of exceptional strength and that was strongly held. That the defenders realized how thoroughly vanquished they were, was shown by the feeble nature of such counter-attacks as were attempted during the day, as well as by the fact that the conquerors were during the night permitted to consolidate the ground that they had secured, almost unmolested. The battle of Messines was from the point of view of the victors a veritable masterpiece of design and of execution.

Not until the evening of the following day, the 8th, did the Germans adventure a general counter-attack upon the positions which the II. Army had won and which it had by that time prepared satisfactorily for defence. Covered by an intense bombardment, the hostile infantry then advanced to the assault along practically the whole of the new front; but they were beaten off at all points. The enemy drew back somewhat from in front of the southern portion of the ground conquered by the II. Army during the next few days, and on the evening of the 14th General Plumer's troops carried their line forward some distance on either flank. Their front thenceforward for some weeks ran almost in a straight line from where it quitted the line held on June 6, opposite the village of Frelinghien at the southern end, to Observatory ridge, situated a mile E. of Zillebeke, where it joined the line held on the earlier date. This represented a length of about nine miles. In depth, the ground wrested from the Germans opposite the centre of the old enemy salient was nearly three miles.

Some very important re-arrangements in the general distribution of the Allied forces N. of the Lys were being carried into effect about the date of the battle of Messines and during the immediately following weeks, in preparation for the Flanders offensive that was to follow. The actual composition of the different British armies also underwent considerable change. Portions of the old IV. Army were moved N. from Artois, under command of Sir H. Rawlinson, to the extreme left of the Allies' line about Nieuport on the coast; this comparatively small IV. Army was to be expanded at a later date and was to play an important part in the operations, should the earlier stages prove as successful as was hoped. On its right were placed the Belgian forces. On the right of these again, and linking them up with General Gough's British V. Army, was brought in the French I. Army under command of General Antoine, which was to act under the orders of Sir D. Haig. Its right was a little N. of Boesinghe, where it was in contact with the Guards Div. which formed Gough's left; the V. Army front extended from thence to near the Ypres-Comines canal where it joined up with the left of the II. Army.

A pause of some weeks in active operations now took place in Flanders, the time being devoted on the side of the Allies to making the elaborate preparations that were necessary before the contemplated offensive could be launched. The lull was however interrupted by an unfortunate incident on the extreme left of the line. In the coast region, the front between Dixmude and the shore followed a line in rear of the Yser river and canal except quite close to the sea. There it crossed over the enemy's side of the waterway, thereby creating a somewhat isolated patch of territory, occupied by troops whose communications with the rear and with their reserves were dependent upon a few floating bridges. This patch consisted near the sea of sand-dunes which from their nature were particularly difficult to entrench. It had been taken over as it stood by the British 1st and 32nd Divs. of the IV. Army and the 1st Div. was on the left next the sea. Perplexed by the arrival of British troops on the coast and anticipating serious developments in this quarter, the Germans determined to strike a blow against the extremely vulnerable sector of the Allies' front lying on the right bank of

the Yser, and they delivered their attack on July 10. The front of the 1st Div. beyond the river was on that day occupied by the 1st Northhamptons and the 2nd K.R.R.C. battalions which had been brigaded together since quitting Aldershot in July 1914. Early in the morning the isolated sector was subjected to an intense bombardment by a great number of guns which had been especially concentrated for the purpose. The bridges in rear were destroyed by shell. Dugouts and shelters were flattened out, and the difficulties of the two battalions were much aggravated by the explosions choking their machine-guns and rifles with sand. When the hostile infantry advanced to the attack the small British force was overwhelmed, only a few small parties eventually escaping by swimming the river. But although the enemy by this stroke gained possession of the left of the isolated sector, their effort against its right portion, held by the 32nd Div., failed. No evil result followed to the Allies, apart from the disaster to the Northhamptons and Rifles.

Although the capture of the Messines-Wytschaete ridge and of most of the high ground on either side of Ypres-Comines canal gap had put an end to the enemy overlooking Ypres from the S., and tended to limit hostile observation of the place from the S.E., the Germans still dominated it, in a measure, from the E., from the N.E. and from the N. This circumstance exercised a very important influence over the arrangements that were being carried out for the offensive about to be undertaken, the first stage of which was to be directed in the main against the invader's defences sited on the high ground lying in a quadrant round the ruined town.

"The various problems inseparable from the mounting of a great offensive," writes Sir D. Haig in his despatch of Dec. 25 1917, "the improvement and construction of roads and railways, the provision of an adequate water supply and of accommodation for troops, the formations of dumps, the digging of dugouts, subways and trenches, and the assembling and registering of guns, had all to be met and overcome in the new theatre of battle under conditions of more than ordinary disadvantage. On no previous occasion, not excepting the attack on the Messines-Wytschaete ridge, had the whole of the ground from which we had to attack been so completely exposed to the enemy's observation. . . . Nothing existed at Ypres to correspond with the vast caves and cellars which proved of such value in the days prior to the Arras battle, and the provision of shelter for troops presented a very serious problem. The work of the Tunnelling Companies of the Royal Engineers deserves special mention in this connexion. It was carried on under great difficulties, both from the unreliable nature of the ground and from hostile artillery, which paid particular attention to all indications of mining activity on our part."

Preparations for the offensive could not in fact be concealed. The forces with which it was proposed to break out from Ypres and to gain possession of the high ground to the E., further out to the N.E., and still further out to the N., were assembled openly during the latter part of the month of July. The Germans were perfectly well aware that they were going to be subjected to a very formidable attack in this region.

The portions of the coming battle-field that lay nearest to Ypres had already been the scene of fierce combats, which have been dealt with in Parts I. and II. of this article. But certain points in connexion with their topography call for some reference, while the arrangements which the Germans had made for defence must also be described. The little river Steenbeke (or Jansbeke as it is called in its lowest reaches) joining the Yser near Merckem, creates together with its tributary streams, nearly all of which join it on the right bank, a feature that proved of considerable tactical importance during the prolonged operations that followed. The main stream and also the watercourses joining it flow northwestward or westward from their sources on the crest of the high ground between the Ypres-Menin road and the village of Passchendaele, with gentle spurs jutting out between them. The most extensive of these spurs is that between the valley of the Steenbeke itself and the low-lying flats of the Yser immediately N. of Ypres, which had come to be known as

YPRES AND THE YSER, BATTLES OF

the Pilckem ridge; it was from this spur that the town was overlooked from the N. But the general direction of streams and spurs alike being that they run from S.E. to N.W., it followed that an offensive directed north-eastward had to cross them successively and that they tended to provide the defenders with a succession of minor positions. Seeing also that, from about the point where the V. Army was in contact with the II. Army, the main ridge ran in a generally northerly direction, while the front occupied by the V. Army before the attack was launched ran from S.E. to N.W., General Gough's forces which were to carry the operation out, with the French I. Army co-operating on their left, necessarily pivoted on their right and in throwing their left forward were confronted by this succession of minor positions. The shallow depressions representing the valleys of the Steenbeke and its affluents tended to be marshy and to flood and become almost impassable in wet weather.

Anticipating that the Allies would embark on a great offensive in this quarter sooner or later, and becoming aware during the spring that such an offensive was actually in preparation, the Germans had taken steps to meet the eventuality with characteristic thoroughness and ingenuity. Experiences on the Somme, on the Ancre and at Arras, as well as on battle-fronts in Champagne where they had been attacked by the French, had taught them that a continuous system of trenches did not proffer an altogether satisfactory form of defence against the terrific bombardments which the Allies could bring to bear, unless abundant underground cover could be provided; and the nature of the soil in Flanders, with water always near the surface, militated against the creation of subterranean galleries. A continuous line in any case offered a favourable target for guns and was objectionable on that account. They were therefore holding the ground over which attack was expected by a system of numerous disconnected trenches and strong points which were arranged in depth rather than in breadth and which permitted of the forward defences being held by relatively small forces, with the idea of gradually absorbing attack rather than of giving no ground at all. Scattered about were small concrete blockhouses with walls of great thickness, which could not be harmed by shell of less than about 6-in. calibre, and which contained garrisons of about twenty men each, with two or three machine-guns; the British soldiers when they came to make acquaintance with them called them "pill-boxes." A defensive system designed after this fashion was more difficult to map by aerial photography than were continuous lines, and a preliminary bombardment directed against it was in consequence necessarily so much the less effective. As their front line near Ypres had been in existence since 1915 and as much labour had been expended upon it the Germans were, however, trusting to the old system to meet the first shock in the event of attack. It was rather in the later offensive operations that the Allies found themselves confronted with the new devices.

The front which Sir D. Haig had decided to extend his initial advance along stretched from opposite Deulemont on the right, to beyond Steenstraat on the left—a distance of over 15 miles. But the most important blow was to be delivered by the V. Army in the middle on a front of approximately 7½ m. between the Zillebeke-Zandvoorde road and the village of Boesinghe (inclusive) on the left. The task of the II. Army to the S. was limited to that of increasing the area threatened, so as to occupy the enemy's attention, only a trifling advance being intended. The French I. Army on the British left was to push forward its right in close touch with the left of the V. Army, with the primary object of securing this against counter-attack from the N. The start of the offensive had originally been fixed for July 25. It was however postponed for various reasons until the 31st. Owing to the enemy having retired out of his foremost trenches along the northern portion of the V. Army front, British and French troops on the 27th crossed the Yser canal (which had hitherto formed an awkward obstacle at this point) about noon, and this enabled bridges to be thrown and it greatly facilitated the attack in the left sector when this took place about three days later.

The order of battle of the V. Army (II., XIX., XVIII. and XIV. Corps), enumerating the divisions from right to left, was as follows:—24th, 30th, 8th, 15th, 55th, 39th, 51st, 38th and Guards Div., with two divisions to each corps in support. The French 1st Div. was next to the Guards beyond Boesinghe. Starting at 3:50 A.M. on the 31st, the Allied infantry generally experienced little resistance at first and only began to meet with serious loss when advancing towards their second objectives. This was particularly the case on the right, where the 24th and 30th Divs. were endeavouring to gain possession of all the commanding ground about and beyond Shrewsbury forest and Sanctuary wood to the S. of the Menin road; they failed to push forward more than a few hundred yards. But further to the left the assailants were successful at almost all points, reaching the line of the Steenbeke and capturing St. Julien. The French stormed Bixschoote, which was beyond the furthest objective given them. Even if the check to Gough's right discounted the completeness of the victory, the third battle of Ypres had opened most encouragingly for the Allies. The Pilckem ridge had been wrested from the enemy so that the town of Ypres was no longer overlooked by hostile forces to the N. and N.E., the front had been pushed forward along its full extent, and over 6,100 prisoners (including 135 officers) and 25 guns had been taken by the British alone.

But the weather had broken. July had up till the 31st been an almost consistently fine month, but that morning opened threatening, and rain came on during the course of the day. It fell steadily all that night and continued without cessation for four days, while for several days following the weather remained unsettled. The low-lying clayey soil, pitted with shell-holes, became a succession of muddy pools. The valleys became almost impassable except at a few points. The delay that ensued gave the German troops time to recover from their defeat of the 31st and also to bring up reinforcements before there could be any question of continuing the offensive; it was not indeed until Aug. 16 that improving weather had sufficiently dried the ground to justify the launching of a fresh general attack. This was again undertaken by the V. Army and by portions of the French I. Army on its left, the Menin road marking about the southern limit of the offensive operations. The four corps of the V. Army (II., XIX., XVIII. and XIV.) were disposed in line in the same order as on the opening day, but on this occasion the divisions in front line were in most cases those that had been in support before. The advance was timed for 4:45 A.M., and the operations were quite successful on the left, but the result on the right was even more disappointing than it had been on the 31st and on this occasion comparative failure extended further along the line toward the left. Except for some trifling local gains of ground the II. and XIX. Corps improved their position very little, suffering repulse at most points; nor was the resistance of the enemy purely of the passive kind, for the Germans delivered some determined counter-attacks, and as a result of several hours of fluctuating fighting the troops in front line in the right half of Gough's Army lost heavily. The XVIII. Corps on the other hand did much better, its left division indeed gaining all its objectives, while the XIV. Corps, still further to the left, was entirely successful. Langemarck was taken, the Steenbeke passed along a front of two or three miles, and a large gap made in the German third line of defence. The French advanced their line all along their front and occupied Drie Drachten on the extreme left, on the borders of the inundation area. Still, if the Allies were entitled, upon the whole, to claim victory in view of what had been accomplished along the left half of the battle-front and of their having secured 2,000 prisoners and 30 guns, their arms had met with reverse in the other half. Nor was there reason to suppose that the enemy losses had been more severe than those of the assailants.

The Flanders offensive, unavoidably started late, had now been in full swing for more than a fortnight, and little improvement in the position had been effected in what represented the really vital sector of the front—the ground about the crest of the ridge stretching away from the uplands won at the battle

of Messines toward Passchendaele. Up there the line had only been advanced a few hundred yards as a result of two regularly prepared attacks. Unless progress could be expedited at this critical point, there was little prospect of achieving the object for which the offensive had been undertaken. It was clear that a fresh force was needed to deal with the enemy in this portion of the sphere of operations, and the British commander-in-chief therefore decided to extend the left of the II. Army northward and to entrust the attacks against the higher ground to General Plumer, who was to work in conjunction with the V. Army farther to the left. Experiences gained on July 31 and Aug. 16 had moreover shown that new methods of attack were called for. The enemy's elastic system of defence—forward trenches weakly held while formidable reserves were kept in hand to counter-attack before assailants could consolidate such ground as they had won—suggested limitation in the depth of objectives, and it called for special artillery concentrations to deal with the hostile counter-strokes when they were delivered. The requisite measures took some time to carry out and the weather moreover continued unfavourable during the latter part of Aug., rendering the ground so waterlogged that a long interval became necessary to permit of its drying to some extent. In Flanders it may be remarked, as in England, humidity of the atmosphere increases rapidly from about the middle of Aug. onward, so that periods of fine weather have less and less effect in absorbing the moisture of the ground as the season advances. The first half of Sept. however, proved bright and dry and the date of the next attack was fixed for the 20th of that month.

The plan of operations for this day was that the II. Army (consisting from right to left of the 10th, 30th, 41st, 23rd, Australian 1st and 2nd Divs.) was to push forward between the Ypres-Comines canal and a point a few hundreds yards S. of the Ypres-Roulers railway, while the V. Army (consisting from right to left of the 9th, 55th, 58th, 51st and 20th Divs.) was to press forward on its left to as far N. as the Ypres-Staden railway. At no point was it proposed to gain more than a mile of ground in depth, and, except about the Ypres-Menin road and immediately to the N. of this, the furthest objectives given to the various divisions were not more than half a mile in advance of the existing line. The weather unfortunately broke during the night of the 19th-20th; but in spite of this the attacks achieved their object all along the front and the efforts of the II. Army were crowned with brilliant success in a sector where previous attempts had to a great extent failed, the crest of the main ridge on either side of the Ypres-Menin road being wrested from the enemy. The V. Army likewise appreciably improved its position. The losses of the attacking side on this day were relatively small, in view of the importance of what had been achieved, and 3,243 prisoners and several guns were taken.

Sir D. Haig followed up the success of the 20th without delay. A fresh thrust took place along a more restricted length of front on the 26th, from about half a mile S. of the Menin road to a point about a mile and a half N. of the Ypres-Roulers railway. The forces detailed for the enterprise, enumerating them from right to left, were the 39th, 33rd, Australian 5th and 4th Divs. of the II. Army, and the 3rd, 59th and 58th Divs. of the V. Army. The Germans had in the meantime been making desperate attempts to recover some of the ground which they had lost about the Menin road and Polygon wood, but without success; and in spite of their resolute opposition they were unable to prevent the British troops from attaining practically the whole of their objectives on the 26th. The rest of Polygon wood was captured, the British position was improved all along the line, and 1,600 prisoners were taken. That the losses should have been by no means heavy on this day as on the 20th showed how effective an answer the method of the shallow objective provided to the enemy's new plan of defence by depth. The combats of Sept. 20 and 26 having given almost the entire crest of the main ridge into British hands to a depth of a mile and a half in advance of the line taken up on July 31, Sir D. Haig arranged for a very important operation to take place on Oct. 4, the front this time extending from Polygon wood to the Ypres-Staden rail-

way, although a minor advance was also to take place S. of Polygon wood and S. of the Menin road.

There was a severe gale accompanied by torrents of rain during the night of the 3rd, and the weather conditions on the following morning were so unfavourable that the ground was in most parts of the battle-field little better than a morass. The enemy moreover was in great strength, especially in the centre; two fresh divisions had been brought up into the German line and, as it happened, these together with the troops already on the spot were drawn up ready to deliver an assault which was timed to start ten minutes later than the hour that had been fixed for the British advance. The consequence was that when the British artillery barrage opened it caught hostile forces that were gathered in mass and it did great execution. The order of battle of the II. and V. Armies was as follows:—37th Div. of the IX. Corps on the extreme right, athwart the Menin road, then the X. Corps (5th, 21st, 7th Divs.) covering the front up to in front of Polygon wood, then the I. Anzac Corps (1st and 2nd Australian Divs.) reaching as far as the Ypres-Roulers railway, and, on their left again and forming the left of the II. Army, the II. Anzac Corps (Australian 3rd Div. and New Zealand Div.); the V. Army was represented by the XVIII. Corps (48th and 11th Divs.) next to the II. Anzac Corps, with the XIV. Corps (4th and 20th Divs.) on the extreme left. The attacking side gained a signal victory this day. Nearly all its objectives were secured, and the gains were especially important in the centre where a firm footing was won along the main ridge about the villages of Molenaerelsthoek and Broodesinde for a length of a mile and a half; a gentle spur stretching back north-westward from this and known as the Gravenstafel ridge was also wholly secured. A hold was gained further to the left on the important village of Poelkapelle on the Ypres-Roulers road; and along all the central part of the zone of operations the assailants pushed their line forward several hundred yards, thereby taking possession of ground of great tactical importance. 5,200 prisoners were taken, including 138 officers, and, besides a few guns, a large number of machine guns and trench mortars were amongst the day's captures. Following as it did rapidly upon the successes of Sept. 20 and 26, the combat of Oct. 4 represented a highly satisfactory achievement, which had moreover been accomplished without very heavy sacrifice. It was not indeed the losses encountered in these well-defined actions that gave grounds for anxiety so much as the casualties which occurred day after day to troops that were clinging to exposed positions, where owing to the condition of the ground it was almost impossible to create effective cover.

A good defensive line had however now been secured. As a result of the offensive operations begun by General Plumer on June 7 and continued intermittently for four months, the crest of the long belt of high ground had been occupied from Messines to within a very few hundred yards of the Ypres-Roulers railway and the situation of the Allies in Flanders had been vastly improved in consequence. Possession of the Gravenstafel ridge would moreover enable Sir D. Haig to establish a strong flanking position, which would render it difficult for the Germans to recover the high ground they had lost by a turning movement from the N. But, regarding the Allied offensive in this part of the theatre of war as a whole, the work was in reality only begun. The Houthulst forest, with the long line of high ground forming the quadrant of a circle beyond it, was still in the enemy's hands. Until the ridge had been secured as far as the vicinity of Staden, it would be premature to embark on the second part of the general scheme of operations—attack on the German positions along the coast between Nieuport and Ostend. Sir D. Haig had now to decide whether he should continue his system of gradual advance N.E. of Ypres, or should call a halt.

"The year was far spent," he writes in his despatch. "The weather had been consistently unpropitious, and the state of the ground, in consequence of rain and shelling combined, made movement inconceivably difficult. The resultant delays had given the enemy time to bring up reinforcements and to organize his defence after each defeat. Even so, it was still the difficulty

of movement far more than hostile resistance which continued to limit our progress, and which now made it doubtful whether the capture of the remainder of the ridge before winter finally set in was possible. On the other hand there was no reason to anticipate an abnormally wet October. The enemy had suffered severely, as was evidenced by the number of prisoners in our hands, by the costly failure of his repeated counter-attacks, and by the symptoms of confusion and discouragement in his ranks. . . . After weighing these considerations, as well as the general situation and various other factors affecting the problem, among them the desirability of assisting our Allies in the operations to be carried out by them on Oct. 23 in the neighbourhood of Malmaison, I decided to continue the offensive further and to renew the advance at the earliest possible moment consistent with adequate preparation."

That the British commander-in-chief in arriving at this decision was largely governed by considerations to which expression could not appropriately be given in a despatch sent in so early as Dec. 25 1917, there can be little doubt. However favourable Oct. weather might be, the whole of the ridge together with the Houthulst forest was most unlikely to fall into the Allies' hands before the winter set in. The persistent rains had had too great an effect upon the soil for this to recover from it before the spring, even if the rest of the autumn were to be dry and favourable. For the offensive plan, as originally conceived, to be carried out in its entirety even in an ordinary season, Sir D. Haig's forces ought to have attained the positions which they had only secured by Oct. 4, at least two months earlier. But he was aware that the fighting capacity of the French armies was for the moment diminished by grave internal troubles, the Russian collapse had set free large hostile forces which were being rapidly transferred to the western front, and if the British offensive ceased, the enemy would regain the initiative and would be free to assail the French front wherever this happened to be weakest. It followed that the British, in spite of the difficulties in the way, must continue their offensive until the coming of winter put an end for the time being to the danger of a German counter-attack.

The hopes which had been entertained at G.H.Q. that Oct. might bring dry weather after the heavy rains experienced in Aug. and Sept., were doomed to disappointment. The days immediately following the combat of Oct. 4 proved worse than ever, and the troops suffered great hardships besides losing many men from hostile shell-fire owing to the lack of protection; they had to trust for shelter to shallow trenches hastily scooped out to join together adjacent shell-holes. The enemy however had been so roughly handled on the 4th that any counter-attacks which were attempted from the hostile lines had little force in them. In spite of the unfavourable climatic conditions a fresh attack was arranged for Oct. 9, the front on this occasion extending from about the Ypres-Roulers railway to the extreme left near Merckem. The order of battle of the II. and V. Armies was as follows:—Anzac I. Corps (Australian I.), Anzac II. Corps (66th and 49th Divs.), representing the II. Army; XVIII. Corps (46th, 48th and 11th Divs.), XIV. Corps (4th, 29th and Guards Divs.), representing the V. Army. On the left of these again was the French I. Army. The night of the 8th was particularly dark, there was heavy rain, and considerable trouble was met with in mustering the troops for the assault so that this was carried out under conditions of extraordinary difficulty. The advance was on this day, in accordance with the programme, pushed farthest forward on the left and about the left centre. The outskirts of the Houthulst forest were gained by the French in spite of much of the low-lying ground being actually under water, and the British troops on their right made good the ground to a depth of a mile and a half about Lange-marck. On the right the assailants were strongly opposed and lost heavily, but they nevertheless gained their objectives along most of their front. 2,700 prisoners in all were taken, with a few guns, and the day's operations could be reckoned as representing a substantial success, if at heavy cost.

A fresh advance was attempted on Oct. 12 in spite of a con-

tinuance of the bad weather and of the ground being in a terrible state. It should be mentioned that in all this later fighting forming part of the great Flanders offensive, the Allied infantry were seriously handicapped by lack of heavy gun support. In such a sea of mud the larger types of howitzer could not be got forward, and in spite of bold and skilful handling the field artillery did not provide an effective substitute. With the Germans it was different. Their heavy ordnance when it was required to move was generally traversing ground that had not been torn up by months of shell-fire and where roads were still in being. The front of attack covered on the 12th was approximately the same as that covered on the 9th and the objectives given to the various divisions only called for an advance of a comparatively short distance; but many of the lower valleys were found to be absolutely impassable owing to the floods, and the operation eventually was not persisted in at most points. 1,000 prisoners were taken, but the attacking side lost heavily, and, although the unsatisfactory result of the effort from the British point of view was attributable to the elements rather than to the enemy, this day's fighting amounted to an undoubted reverse to the cause of the Allies.

All hope of making any appreciable gains of ground except in one particular sector was now abandoned by G.H.Q., although the front was slightly pushed forward in the region of the Houthulst forest by dint of some skilfully carried out minor operations during the next few days. The one sector where it was determined to continue the offensive was the ground between the Ypres-Roulers railway and the neighbourhood of Poelkapelle. The II. Army was in possession of the crest of the ridge about Broodseinde and where the railway traverses this; but further to the left the line ran diagonally across the rearward slope of the heights and was commanded from these at short range. Having once pushed forward beyond the front that had been taken up as a result of the successful combat of Oct. 4, it had become almost imperative to secure possession of the village of Passchendaele as well as some rising ground immediately to the N. and N.W. of that place, and to arrange that the line should run back in a westerly direction from this point, at right angles to, and not diagonally across, the ridge. This would create a sharp salient; but Passchendaele was a commanding point, and the lie of the ground between it and Poelkapelle would favour the establishment of a strong defensive line for the winter. Sir D. Haig therefore decided to continue the offensive immediately to the N. of the Ypres-Roulers railway on a narrow front, and in order to give this a fresh impetus he brought the Canadian Corps round from Lens. A number of readjustments of the order of battle of the II. and V. Armies also took place, for some of the troops about Ypres were required for the offensive secretly prepared in the Cambrai region.

The weather after Oct. 12 showed distinct signs of improvement, although at this late season of the year there could be no hope of the saturated soil recovering very appreciably from the effects of those abnormal autumn rains which had proved the most formidable antagonist of the Allies in Belgian Flanders. But the signs proved delusive, for on the 25th, the very day before a fresh attack had been arranged, heavy rain set in again. This operation only covered the front between the Ypres-Roulers railway and Poelkapelle, the main advance being intended to take place in the right centre and right. The troops detailed for the undertaking were, enumerating them from right to left, the Australian 1st Div., the Canadian 4th and 3rd Divs., the 63rd Div., and part of the 58th Div. But what amounted to an independent operation (except in that it must occupy the enemy's attention on a part of the front only about 2 m. from the main attack) was also undertaken on this day by the 5th and 7th Divs. on either side of the Ypres-Menin road. In spite of unfavourable weather and the deplorable state of the ground important progress was made by the Australian and Canadian troops, the latter getting up close to Passchendaele and successfully withstanding heavy counter-attacks in most portions of the ground which they had won. The 63rd and 58th Divs. also reached their objectives; but they were not called

upon to push the line forward more than a short distance, their task rather being to link up the ground won by the Canadians with the old line near Poelkapelle. Some hundreds of prisoners were taken. The operation further to the S., on the other hand, which only had a very limited objective, was unsuccessful. The purpose had been to capture the village of Gheluvelt and to improve the position somewhat a little further to the N.; the possession of Gheluvelt on its well-defined spur running south-eastward would create as it were a bastion to flank the forward slopes on either hand. But after very nearly gaining their objectives at the outset, both the 7th and the 5th Divs. were driven back to their starting point, and they suffered heavily in casualties during a furious combat. With the ground in the condition that it was in, rifles were apt to become choked with mud, while percussion shell buried themselves in the swamp doing little harm by their explosion; these conditions however affected both sides equally.

Between the 26th and the 28th Belgian and French troops made an important gain of ground on the extreme left of the line, securing possession of the flats as far forward as the Blanckaert lake. And on the 30th a fresh attack was made between the Ypres-Roulers railway and Poelkapelle by the same troops as had fought on the 26th, but on a narrower front this day as most of the high ground in the direction of Passchendaele which Sir D. Haig was anxious to occupy had been captured in the previous combat. Some progress was made; but the Germans offered a very stout resistance at important points, although at others they showed some symptoms of losing heart and some of them even abandoned their posts at the outbreak of the fight. Owing to the front of attack now being restricted and to the object which the assailants had in mind being obvious, the enemy was concentrating a very heavy artillery fire upon the area that formed the battle-field, and in their efforts to get to Passchendaele the Canadians suffered heavy losses on this day. The 63rd and 58th Divs., further to the left and attempting to get forward on lower ground, found this almost impassable and they only advanced their line slightly here and there. But up on the main ridge what had been achieved paved the way for a brilliant success a week later. At dawn on Nov. 6 the Canadian 2nd and 1st Divs. suddenly advanced and captured Passchendaele together with the somewhat higher ground immediately to the N. and N.W. of the village, also taking 400 prisoners. This fine achievement can fairly be set down as the closing incident in what has been called "The Third Battle of Ypres." One or two attempts were made within the next few days to improve the position in the sector where the Canadians had made such substantial gains, and these were partially successful, but they did not appreciably modify the situation.

The prolonged succession of combats, many of them (such as the capture of the Messines-Wytschaete ridge by the II. Army and the very successful operations on July 31 and Oct. 4) reckoning as unqualified victories to the credit of the Allies, had transformed the situation in Flanders. The chain of heights from N. of Armentières to Passchendaele had changed hands. The Ypres salient, vastly extended, so far from its constituting a weak and barely defensible sector of the Allies' front, had become a serious danger to the enemy. Sir D. Haig had secured an excellent defensive position between the Yser and the Lys. Great hostile forces had been kept fettered to the north-western extremity of the western front, striving to maintain possession of a tract that had been captured by the invaders some three years before. But the main object for which the offensive had been undertaken had been only very partially attained. The German hold upon the coast district remained unshaken. The line of high ground to the N. of Passchendaele and circling round beyond the further outskirts of the Houthulst forest, as also that forest itself, remained in the enemy's hands. The third battle of Ypres, chiefly perhaps because of unfortunate delays in starting the operations and of untoward weather conditions after they had been started, had not prepared the way as had been intended for subsequent advance upon Ostend and the great plains N. of the Lys.

(C. E. C.)

IV. BATTLES OF SEPTEMBER 1918

At the end of Aug. 1918, when the French counter-offensive, commenced on July 18, and the British counter-offensive, begun on Aug. 8th, had both been crowned with success, the initiative in strategy had been definitely taken out of the hands of the German command. The enemy had been driven from the salients of Château-Thierry and Montdidier, which were his conquests of March and May.

Thanks to British shipping, each month 250,000 American soldiers were being landed on French soil, and this increasing wave of troops, young and fresh, gave the Allies a superiority in numbers and *matériel* which grew day by day.

Desiring that the enemy should have no opportunity to recover from disorganization and fatigue, Marshal Foch proposed to continue the operations by a triple attack, to which end three actions were to commence about Sept. 25 at 24-hour intervals.

The American I. Army and the French IV. Army were to attack on both sides of the Argonne in the general direction of Mézières. The British I., III. and IV. Armies and the French I. Army were to push towards Cambrai and St. Quentin, and break through the famous Siegfried position or Hindenburg line. The Belgian army, the British II. Army and certain French divisions, who would presently join them, formed the group of the armies in Flanders under the supreme command of H.M. the King of the Belgians, and would undertake the operations in Flanders. This force in the first place was to secure the Flanders ridge and having conquered this to push on the left wing toward Bruges-Ghent with the object of freeing the Belgian coast, while the right wing would push toward Courtrai-Renaix in such a manner as to cause the evacuation without fighting of that vast inhabited region Lille-Roubaix-Tourcoing.

At the request of King Albert, General Degoutte of the French army took over the duties of chief-of-staff of the group of armies in Flanders.

The German Position.—The Belgian army and the British II. Army were ordered to seize the Flanders heights, the line which, starting from Hill 10 toward the S.E. of Dixmude, reaches Hill 43 at Clercken, passes round the forest of Houthulst by the Stadenberg, passes by Westroosebeke, Passchendaele, Zonnebeke, beyond Ypres to Gheluvelt, Hill 60, Wytschaete and Messines. The line continues to the right toward the W. by Mont Kemmel, Mont Rouge, Mont Noir and Mont des Cats, which form the watershed of the rivers Yser and Lys.

At this period nine German divisions held the sector Dixmude-Armentières: three or four being at rest behind the front line. The first line of German trenches passed by Dixmude, Woumen, the Chateau Blanckaert, Langemarck, St. Julien, Zillebeke, St. Eloi, Wytschaete, Messines, and the river Lys to the W. of Armentières. This was a zone of cover behind which the Germans had echeloned four successive positions, the product of four years of stability which had been strengthened with particular care in 1917 to resist the British offensive that year.

These were characterized by the use of concrete groups, very numerous and strong, of the type of the famous "pill-boxes" of Stirling Castle, Inverness Copse and Poelkapelle. Some of these contained sections of artillery with gunners and ammunition: generally they sheltered one or two sections of machine-guns, the fire of which covered the intervals and afforded flanking fire to each other. Everywhere were vast stretches of a network of barbed wire in front of dugouts and trenches affording an entire continuity of obstacles.

The terrain of the attacks had been entirely overturned by the bombardments in the British offensives of 1917: every vestige of cover had disappeared; only some mounds of walls marked the position of villages; the soil was riddled by the shell-holes adjoining each other; the land drainage system no longer functioned, every ditch was full of water and the field of battle everywhere was a vast and foetid bog (slough) in which progress was arduous. The network of roads was hidden under the mud and any advance would be as difficult for the lines of skirmishers as for the artillery horse-teams and the supply convoys.

YPRES AND THE YSER, BATTLES OF

The German artillery had the advantage of the commanding positions. Their observation posts on the ridges enabled them to fight effectively over the entire country of the attack. Again, in the centre of the sector assigned to the Belgian offensive stands the forest of Houthulst, a renowned strong-point, and a bastion for artillery which dominated with its fire a great part of the Belgian and British fronts. As Marlborough had said:—"Whoever is Master of the Forest of Houthulst is Master of Flanders."

Plan of Attack.—About Sept. 15 the Belgian army, 12 divs. of infantry and one of cavalry, held a front of 35 km. from the sea at Nieuport-Bains to the northern outskirts of Ypres.

The British II. Army, 10 divs. of infantry (General Plumer), occupied the sector Ypres-Armentières, about 20 km. in length.

The moral of the two armies was excellent: the British troops aspiring to seize from the enemy the fruits of their successes in the spring; the Belgians seeing the day at length dawn, which they had so anxiously awaited, when they should leave the lines on the Yser and hasten to the deliverance of their country.

King Albert, commander-in-chief of the group, decided that the first operation should have as its object the conquest of the following objectives. For the Belgian army: Dixmude, Clercken, Stadenberg, Passchendaele, Broodseinde. For the British army: Molenaershoek, Polygon wood, Hill 60. From these points the armies would advance eventually to the attack on subsequent objectives. The Belgian army placed 11 divisions in the line, of which one was a French division; the British army employed six divisions. On the extreme left, two Belgian divisions remained in their sector on the front Nieuport-Dixmude. They were to hold themselves in readiness to push forward on the first order and clean up the left bank of the Yser in the inundated area, and to take the opportunity to release the flood-water. On the extreme right, the British divisions which were furthest S. were to watch for any indication of weakness in the enemy in order to follow up and hasten his retreat. Two divisions of French infantry which were now arriving, and the division of Belgian cavalry, constituted the general reserve.

The Belgian 4th Div. crossing the Yser immediately to the S. of Dixmude was to secure the ruins of the village and seize the former line N. of Dixmude and Zarren and the length of the canal of Houdzaeme. The British 14th Div. formed the flank-guard at St. Eloi. The frontage of the principal attack was—Clercken-Gheluvelt—a little over 20 km. in length, so that the frontage of attack of each division of the first line was about 2 kilometres. The British 9th and 20th Divs. placed two brigades in the first line and one brigade in the second line; the 35th Div. had all three brigades in the first line. All the Belgian divisions uniformly adopted the *carrée* formation: all of their three regiments were together; in each regiment the battalion in the first line pushed straight ahead, the battalion in the second line advanced taking special care to reduce any strong points of resistance and clearing up any such positions overrun by the first line; the battalion in the third line, held as long as possible in reserve, was employed to pass eventually the first line and thus to undertake the continuation of the advance. In this formation the Belgian army had 24 regiments in the front line placed side by side in three lines of battalions. This offensive disposition is noteworthy. Taking everything into consideration, there is no other example in the whole war of the deployment of an army which shows more audacity, more determination, which promised a greater promptitude in employing all units, and greater rapidity in opening up the battle.

The Belgian army, united to a strong contingent of French and British artillery, formed a mass of artillery of 1,550 guns, of which 280 were trench guns and 500 heavy artillery. The British II. Army had about 1,000 pieces, of which half were heavy. Therefore on the actual frontage of the attack Dixmude-St. Eloi (about 25 km.) the Allies possessed some 1,800 guns both heavy and field, independently of trench artillery. The greater part of the Belgian batteries had been placed E. of the Yser canal and Ypres; a certain number held a position to the E.

of Martjevaart and also in the peninsula of Luyghem, only those batteries of very long range and insufficiently mobile remained on the W. bank of the canal.

The attack was to be preceded by a violent preparatory bombardment of one duration of three hours. The movement of the artillery during the advance was made the subject of special orders, and it was arranged that in each division of the first line a group of 7-5 would be allotted to accompany it and distributed at the strength of one battery for each regiment of infantry.

Action of Sept. 28.—All the preparations for the attack had been carried out with the greatest secrecy. Artillery action had been very feeble for many days. Batteries and ammunition had been pushed forward and installed in the first lines under cover of careful camouflage; divisions had been concentrated in the sectors of attack and had been deployed for the battle entirely by night marches. On Sept. 28 at 02:00 (morning) the 17 divisions were in their battle positions; a vast body of men ready to march against the enemy with enthusiasm and in perfect order. At 02:30 hours there commenced on the whole front of the two armies a powerful bombardment of preparation which was to last for three hours. At 05:30 hours the infantry left their advance positions preceded by a creeping barrage.

The rain almost at once commenced to fall heavily, making every movement yet more laborious. Overcoming every obstacle they encountered, the Belgians secured in one magnificent sweep the Francken, Preussen and Bayern Stellung.

At 07:30 the last obstacle was passed, except for the northern group, and the field artillery proceeded on their way to accompany immediately the subsequent attacks. The enemy only feebly counter-attacked. The northern group had at the outset encountered a stubborn resistance at the Château Blancaert which the defenders held to the death, as well as an adjoining farm. These strong-points were not secured until about midday. Beyond the Bayern Stellung the Germans counter-attacked and put up a vigorous defence.

In the northern group the centre of the attack was the conquest of the forest of Houthulst, filled with obstacles and ambushes, and in addition the burnt trunks of trees and torn branches—the result of four years of bombardment—proved an impenetrable entanglement where advance was only possible along the straight drives set at right angles, and these were barred by wire and enfiladed by machine-guns.

On the left, while the Belgian 4th Div. seized Rille and St. Pieters, the Belgian 1st Div. secured the Château Blancaert, Hoog Kwartier, while with a gallant rush the 22nd Regt., having conquered at the point of the bayonet many batteries which the gunners fired until the last moment, arrived at the crossroads of Houthulst at 11:00 hours and occupied it.

On the right, the Belgian 7th Div. drove right through the forest and arrived at the end of the day on the eastern boundary, having conquered it entirely with many dozen of cannon and important material.

In the centre group the Belgian 3rd Div. reached without difficulty the heights by the station of Poelkapelle, where they held up some violent counter-attacks which debouched from the S.E. corner of the forest; these attacks were strongly thrown back as far as Schaap-Ballie, which the division occupied at the same time as the 9th Div. arrived at the outskirts of Westroosebeke.

In the southern group the 6th and 12th Divs., held up by the terrible condition of the ground, reached halfway to the crest-line Westroosebeke-Passchendaele and found the enemy occupying in force this strong position. Further bombardments by the artillery and many assaults left the situation unchanged. Toward the end of the afternoon a strong German counter-attack forced itself into line after line of the 6th Div. However, the 8th Div., which had seized Broodseinde, advanced on Moorlede and at 20:00 hours the 4th Carabiniers took Passchendaele by assault. To summarize, the nine Belgian divisions of infantry which had been engaged, accomplished under heavy rain an advance of about 8 km. across the most appalling country, bristling with every defensive accessory and abundantly fur-

nished with machine-guns; they had conquered the famous bastion of the forest of Houthulst and captured over 4,000 prisoners besides considerable material.

As for the British II. and XIX. Army Corps, they had reached all their objectives: Becelaere by the 9th Div., Krivisecke by the 20th Div., Zandvoorde by the 35th Div. Thus on the first day over the whole frontage of the Belgo-British attack there had been greatly exceeded the extreme limits of the victories of the third battle of Ypres (July-Nov. 1917)—that battle of giants wherein 51 divisions of British and 78 divisions of the Germans had disputed the same country foot by foot for four months with a vigour unknown in history.

Action of Sept. 29.—It was of importance that this brilliant success should be followed up with the greatest vigour. The following day the battle recommenced at 06:00 hours after artillery preparation of half an hour. It was intended to force the *Flanders II. Stellung*. In the northern group, after the 1st Div. had secured Clercken and Ternst, the 10th Div. conquered Ruyter Hoeck and Zarren. At 09:00 hours the 4th Div. had taken Woumen and Essen and proceeded to encircle Dixmude. Toward noon the division proceeded to clear up the town. With the central group, the battle was particularly vigorous: the 3rd Div. occupied in the first place Vyewege and in the afternoon made an assault on Stadenberg, which was secured at 16:45 hours after an obstinate fight.

The 9th Div. threw six attacks against Westroosebeke without gaining a foothold.

In the southern group the 8th Div., followed by the 11th Div. and fighting side by side with the British 9th Div., prepared to attack Moorslede when the latter division was carrying Keiberg.

About 13:00 hours the 8th Div. found itself 500 metres W. of Moorslede. The attack was made at 14:00 and secured the position after a severe fight, and completely forcing the enemy line, advanced the 7th Regt. toward St. Pieter, on the road Menin-Roulers, which was occupied at nightfall. On the left, the 12th Div. was taking the woods of Kalve and Callimolenhoeck; to the right the British 9th Div. secured Keiberg and penetrated into Danizeele. During the day's action four fresh German divisions were encountered.

Action of Sept. 30.—On Sept. 30 the 3rd Div. occupied Staden; the Belgian 9th Div. entered the evacuated Westroosebeke and occupied the outskirts of Oostnieuwkerke.

The other divisions undertook by certain local engagements to rectify a frontage which was based on the first line of the *Flanders I. Stellung*. This position, established by the Germans in 1917, was strongly held, abundantly furnished with machine-guns and barbed wire, and supported by the artillery disposed on the whole front from Handzaeme to St. Pieter.

The first days of Oct. marked a halt in the operations. Only on the outskirts of Oostnieuwkerke and of Moorslede were there any lively combats. In front of the British the Germans menaced by the salient of Moorslede were withdrawing progressively their front line to the line of Wedlgem-Cominca-Warnceton, in front of which the troops of Gen. Sir H. Plumer installed themselves at 17:00 hours.

To sum up, the Belgo-British offensive which was delivered on Sept. 28 gave the most highly satisfactory results.

The progress realized had carried the Allied front about 15 km. from their starting point. The whole of the heights of Flanders was conquered. More than 8,000 prisoners, of which 6,000 were taken by the Belgians, were captured. 500 guns, machine-guns and material in proportion were the spoil of the victors. Thirteen German divisions had been engaged.

This rapid advance carried the Allied divisions beyond the zone of country so deeply cut up during the battles of Ypres. It was not possible to continue the advance before having built up across this historic stretch of mud sufficient communications for food and supplies for the troops. The reestablishment of a network of communications in this country, so completely cut up and full of water, constituted a delicate and most arduous task, which in spite of all efforts ought to have stopped the operations for a considerable time.

The crisis was most acute for two or three days, and certain divisions existed altogether on food supplies thrown from aeroplanes. Thanks to the most vigilant activity the troops found themselves ready to take up the offensive on Oct. 14. The success took them this time to Bruges and Courtrai, and assured the freeing of the coast and evacuation of the region round Lille.

Battle of Courtrai-Thielt-Thourout.—The battle of Sept. 28-29 had put the Belgo-British in possession of the heights of Flanders, and had taken the Allied armies in one bound beyond the country of the Ypres battles. The reestablishment of communications across this zone absorbed the first days of Oct. On Oct. 6 the King of the Belgians sent out instructions for the continuance of operations.

The intention of King Albert was that, taking as a base of departure the positions conquered at the end of Sept., the Belgian right flank and the British on the left flank should push vigorously toward the last and seize the knot of communications at Thourout, Thielt and Courtrai.

These points conquered, an advance should be made from Thourout in the direction of Bruges, which would inevitably insure the deliverance of Ostend and of all the coast. Proceeding from Courtrai and combining their movements with the British I. Army which was marching on Valenciennes, the British II. Army would undoubtedly cause, probably without fighting, the liberation of the populous and industrial region Lille-Roubair-Tourcoing. In consequence the Belgian army, reinforced by the French VII. and XXXIV. Corps, would seize the plateau of Hoogdele-Gits and the centres of Thourout, Thielt and Oostroosebeke, and then be prepared to follow the enemy towards Bruges and Ghent. The British II. Army would carry on the front on the Lys from Harlebeke to Menin. It would proceed to follow the enemy as far as the Scheldt. The II. Cavalry Corps and two divisions of French infantry would remain under the immediate orders of the King as a mobile reserve.

From Oct. 7 the corps commanders had caused the necessary cannonade to effect breaches in the wire entanglements and for the destruction of the most important enemy defences. On Oct. 14 the general attack was launched at 05:30 hours without any further artillery preparation.

The German order of battle was as follows from N. to S.:—38 Div. L.; 3 Div. R.; 36 Div. R.; Div. Guards Reserve; 1 Div. R.B.; 6 Div. R.B.; 11 Div. R.; 56 Div.; 12 Div. These divisions had all their three regiments side by side and in each regiment two battalions were placed in the first line. They were on the alert, and the three battalions occupied their battle positions.

However, the first lines of the enemy were quickly captured. The German defence was chiefly based on the employment of machine-guns. The Allied smoke-shells created a dense cloud which in the majority of cases prevented the enemy from making effective use of his weapons. The reply of the German guns was very serious, and very many heavy pieces on rails were employed. In the course of the day, six support divisions were brought into the line: they were used less for counter-attacking than to strengthen the front where broken.

In the evening the northern Belgian group had conquered Handzaeme as well as Cortemarck: the French, assisted by many sections of tanks, had secured Hoogdele and Roulers.

The southern Belgian group, led by the valiant 3rd Div., had completely defeated the Guards Reserve Div. and the Bavarian 1st Reserve Div.: they had taken Rumbeke, Ouckene, pushed almost to the gates of Iseghem and captured 1,300 prisoners and many batteries, of which some had both teams and personnel.

Further S., the British forces had thrown back the enemy on the Lys in the neighbourhood of Menin, and had taken Wynberg, the western outskirts of Gullegghem and Winkel St. Eloi, 20 enemy aeroplanes had been brought down.

On Oct. 15, while the Belgians in the N. gained ground to within 2 km. of Thourout and the British in the S. captured Gullegghem and then Heule, the indefatigable 3rd Div. (Belgian) passed through Lemdelede at 11:00 hours and Cappelle Ste. Catherine, and the 9th Regt. of the line pushed on irresistibly almost to Bavichove near the Lys.

On Oct. 16, after half an hour of artillery preparation, the attack recommenced on the whole front. The northern Belgian group captured the wood of Wymedaele and of Thourout, the French pushing on beyond Lichtervelde and Ardoye; the southern Belgian group occupied Iseghem and Ingelmonster, the 3rd Div. touching the canal at Roulers and the Lys at Oygghem and Bavichove. Thus were gathered the fruits of victory. The enemy front, everywhere completely shaken, beat a retreat. The German Marine Divs. evacuated the coast sector which they had guarded for four years.

Explosions and fires announced that the enemy was destroying his installations and his depots at Middlekerke, Smaeskerke, at Ostend and Guistelles. In the evening the coast-guns, levelled for so many months toward the sea, fired in haste some rounds at the Belgian bivouacs before being rendered useless.

On Oct. 18, in the evening, the Belgian front reached Zeebrugge and Bruges. The British bordered all the Lys from Menin to Harkebeke and penetrated into Courtrai.

On Oct. 20 the Germans were thrown back on the canal of the Lys behind which they momentarily held a position from Eccloo to Deynze. The British II. Army crossed the Lys at Courtrai, occupied on the right Rollegem and Leers, and made certain the evacuation of Roubaix, while the left was pushed toward Anseghem. By Oct. 31 the British had reached the Scheldt from Kerkhove to Pecq, joining the British V. Army.

The battle of Thourout-Thielt-Courtrai was finished. Under protection of their rear-guards the broken German front turned itself to the E., followed by the Allies as quickly as the restoration of the network of roads permitted.

From Oct. 14 to 31 the group of the armies of Flanders had taken 19,000 prisoners and advanced 50 km. It had gloriously achieved the double mission entrusted to it by King Albert: the region of Lille was entered and set free; the coast and an important portion of Belgian territory had been reconquered.

Belgians, British and French had rivalled each other in their ardour and bravery. The submarine base of Bruges, the famous batteries of Tirpitz, Hindenburg and Deutschland, and more than 100 coast-defence guns of very great calibre remained as trophies taken from the enemy,—marking the downfall of the ambitions of the Germans. (R. VAN O.)

YUAN SHIH-K'AI (1859-1916), Chinese statesman, born 1859, first attained distinction in Korea, when, as Imperial resident and the trusted lieutenant of the Viceroy Li Hung-Chang, he strove to preserve China's suzerainty over the Hermit Kingdom in the years of strife which preceded the war between China and Japan (1894). After that disastrous campaign he held office under the Viceroy Li in Chihli; in 1898 he was in command of an army corps and played a decisive part in frustrating the Emperor's plan of constitutional reform and in supporting the Empress Dowager's reactionary *coup d'état*. After her return to power he rose rapidly; during the Boxer rebellion, as governor of Shantung, he displayed sagacious foresight in the protection of foreigners, and upon the death of Li Hung-Chang succeeded his chief as Viceroy of Chihli. At the time of the death of the Empress Dowager (1908) he was a Grand Councillor and her most trusted adviser; but upon the accession to power of Prince Chun as regent he was dismissed from office (in retribution for his failure to support the Emperor in 1898) and ordered to return to his native place in Honan (Jan. 2 1909). He remained there, in disgrace, until the outbreak of the revolution in 1911, when the regent and the court, alarmed at the rapid spread of the movement, turned to him for help. By an edict of Oct. 14 he was appointed Viceroy of Hunan and Hupeh and commander-in-chief of the Imperial forces. As military dictator he took the field a fortnight later against the revolutionary army at Hankow. Thereafter, until his death (June 1916) the Government of China, such as it was, lay in his hands. After the abdication of the Manchu Dynasty, which he had done his best to uphold, he accepted the Presidency of the Republic and took the oath of office in March 1912; but he did so with mental reservations which were obvious to those who had followed his career and observed his policy. As President he displayed statesmanship of a high

order under conditions of exceptional difficulty. Judged by European standards, his methods were often indefensible, but until he aspired to found a new dynasty in his own person (1915) their ruthlessness and venal expediency were generally accepted by the nation without indignation, and regarded as consistent with time-honoured traditions of rulership. All his efforts of statecraft were steadily directed towards restoring the authority of the central Government, shattered by the revolution, and with it, the principles and practice of benevolent despotism. His monarchical plans were skilfully laid and would probably have succeeded if he had had to deal only with his own people; they failed, and he died a broken and humiliated man, because he had not allowed for the probability of intervention by the Japanese Government. His enthronement as Emperor had been fixed by proclamation for Feb. 9 1916; before that date the Yunnan rebellion had vindicated the "advice" of the Japanese minister at Peking, and the end of his career was in sight. But he declined to resign the Presidency, and died, as he had lived, in harness.

YUDENICH, NIKOLAI (1862-), Russian general, was born in 1862 and entered the army in 1881. Passing out of the General Staff College in 1887, he spent the rest of his military service on the general staff and specially in Turkestan, till in 1902 he became a regimental commander. In the Russo-Japanese War of 1904-5, in which he was wounded, he had the reputation of a valiant and careful chief. He became a general and commander of a rifle brigade in 1905, assistant chief-of-staff of the Caucasian military district in 1907, and chief of the same staff in 1913. Having carefully studied the Caucasus and its army, he was quite prepared for the conduct of operations on this front, and at the beginning of the World War he rendered great services in the crisis and victory of Sarikamish as commander of the II. Turkestan Corps. Soon afterwards he was put in command of all the military forces of the Caucasus, which he held during the operations of 1915 until the arrival of the Grand Duke Nicolai. He continued to serve on this front under the new governor-general and played a leading part in the operations which led to the fall of Erzerum on Feb. 16 1916. In the summer campaign further progress was made, and Baiburt and Erzincan were taken. Later, when the advance had outrun the organization of the rear, the situation was saved by his prompt manœuvres.

In March 1917, on the departure of the Grand Duke, Gen. Yudenich again undertook the command of the Caucasian armies, but here, as elsewhere, further advance was paralysed by the increasing disorganization of the Russian army. In the course of the civil wars Gen. Yudenich in 1920 carried out a campaign from the Baltic provinces against Petrograd, but unsuccessfully.

YUGOSLAVIA, or JUGOSLAVIA.—The "Kingdom of the Serbs, Croats and Slovenes" (*Kraljevina Srba Hrvata i Slovenaca*), more commonly known as Yugoslavia, came into being in the closing months of 1918 as a result of the collapse of Austria-Hungary and the voluntary union of its Yugoslav territories with the former Kingdoms of Serbia and Montenegro. In point of international law, its existence may be said to date from Dec. 1 1918, when the Prince-Regent Alexander of Serbia formally complied with the invitation of the Yugoslav National Council to assume the regency over the sister provinces also. That the Great Powers were so long in according official recognition to the new state was due to purely political reasons connected with the Adriatic dispute.

Yugoslavia consists of the former independent Kingdoms of Serbia and Montenegro; the triune Kingdom of Croatia-Slavonia-Dalmatia (of which the first two enjoyed special autonomy under the Kingdom of Hungary, and sent 40 delegates from their own Parliament in Zagreb to that of Budapest, while the third was one of the 17 provinces of the Austrian Empire, with a local diet at Zara); parts of the Banat, Bačka and Baranja (which were integral portions of Hungary proper); Slovenia (consisting of portions of Carniola, Carinthia, Styria and Istria, each holding a position in Austria analogous to Dalmatia); and Bosnia-Herzegovina (which was from 1878 to 1918 under the joint administration of Austria and Hungary and had its own diet since 1910). Fiume, which from 1867 to 1918 had been an

autonomous unit under Hungary, has by the Treaty of Rapallo been constituted as an independent State. Italy has acquired almost all the Slovene and Croat districts of Gorizia and Istria.

A census of the new State was taken in the spring of 1921, the total pop. being 12,162,900.

Early Tendencies Toward Unity.—The Yugoslav movement was by no means a recent one, as is often assumed. Despite the different traditions of culture due to the rival ecclesiastical influence of Rome and Byzantium, a sense of kinship had survived throughout centuries of separation, and was strengthened by continual migration. The two most notable cases were the formation of the Uskok pirate settlements along the Dalmatian coast in the 16th century, and the settlement of the Serbian patriarch and many thousand Serb refugee families in Slavonia and S. Hungary, at the invitation of the Emperor Leopold I. in 1690. Ivan Gundulić and the brilliant group of poets that gathered round him at Ragusa in the early 17th century, reflected in their writings the little Slav Republic's intimate connexion with its kinsmen of Serbia and Bosnia. The first advocate of the Pan-Slav idea in Russia itself was Križanić, a Croat Catholic priest from Dalmatia, and early writers in favour of Slavonic racial and literary unity were the Slovene schoolmaster Bohoricz (1584) and the Dalmatian Croat Orbini, who wrote in Italian (*Il regno degli Slavi* 1601). The Franciscan friar Kačić, who did so much for the revival of popular poetry in Bosnia and Dalmatia in the mid-18th century, shows similar traces of Serbophil feeling, and the achievements of Dušan and other Serbian Tsars have bulked almost as largely in the modern literature of the Croats as of the Serbs themselves.

The first active impulse toward political unity was given by Napoleon, when after Wagram he erected the Slovene districts

and most of Croatia and Dalmatia into a separate Illyrian State, incorporated in the French Empire, but having its administrative capital at Laibach. This short-lived experiment, which inspired the muse of Vodnik, the first Slovene poet of real mark, had its aftermath in the Illyrian movement of the forties, which centred in Zagreb, the Croatian capital. Its real motive force was supplied by Ljudevit Gaj, who combined to a remarkable degree the qualities of author, philologist and political agitator. His two newspapers, the *Illyrian National Gazette* and the *Danica Ilirska* (*Illyrian Daystar*) provided a literary focus for the rising generation; while his reform of Croat orthography, planned on parallel lines with Vuk Karadžić's epoch-making philological work in Serbia, assured to modern Serbo-Croat literature a definitely unitary development. The fact that linguistically Serb and Croat had thus become interchangeable terms, only to be distinguished by the respective use of the Cyrillic and Latin alphabets, inevitably reacted upon the political situation, and served as an incentive to the movement for unity. In somewhat sensational and affected but prophetic words Gaj compared Illyria to a lyre, "a triangle between Skutari, Varna and Villach. Its strained and inharmonious chords are Carinthia, Gorizia, Istria, Croatia, Slavonia, Dalmatia, Ragusa, Bosnia, Montenegro, Herzegovina, Serbia, Bulgaria and Lower Hungary," and "on the great lyre of Europe they must harmonize once more." He saw in the Magyars the chief obstacle to the realization of his dream, and openly warned them that they were "an island in the Slav ocean," which one day might easily engulf them. The alienation of Croat and Magyar—for centuries close allies in the struggle against the Turk—grew rapidly in the 'forties, mainly owing to the aggressive legislation passed by successive Hungarian diets,

and tending to curtail Croatia's ancient liberties and extend the sway of the Magyar language. It was a fertile soil for Gaj's agitation, and in 1848 the Croatian nation found in Baron Jelačić a military leader who voiced the Illyrian idea and hoped to realize it in union with the Habsburg Dynasty and the other subject nationalities of Hungary. It is highly significant that Jelačić as Ban of Croatia went hand in hand with the newly elected Serb-patriarch Rajačić: that Croats and Serbs, including many volunteers from the principality of Serbia, fought side by side against Hungary, and that the poet-prince-bishop Peter II. of Montenegro wrote to Jelačić, expressing his solidarity with the movement.

Croatia after 1848.—After the collapse of the Hungarian revolution in 1849, the Croats, in the words of Pulszky, received as reward the same absolutist régime which had been imposed upon the Magyars as punishment. Jelačić and Gaj died as disappointed men, and the very general resentment aroused by the ingratitude of Francis Joseph vented itself also against the name of Illyria, which rapidly disappeared from the political arena. But its place was taken more and more by Yugoslavia, which, it should be remarked, was then still used to denote all the territories inhabited by any southern Slav tribe, and so to include the Bulgars no less than the Serbo-Croats and Slovenes. On the intellectual side the new movement found its champion and its Maecenas in Bishop Strassmayer, who for over 50 years devoted the surplus revenues of the wealthy see of Dya Kovo (Djakovo) to national purposes, and was mainly instrumental in founding at Zagreb the southern Slav Academy (1867), the first Croat university (1874) and a modern gallery and school of arts. Historical research and literary criticism flourished under Rački, the first president of the Academy, and his pupils; while Strassmayer did much to revive the Glagolitic, or ancient Slavonic liturgy, and to win for it the favour of Pope Leo XIII. Close relations linked the great Bishop with Prince Michael, Serbia's ablest modern ruler, and with Prince Danilo of Montenegro who assured Michael, "Form the Kingdom of Serbia, and I will mount guard before your palace."

The Dual System.—In the late 'sixties the Yugoslav idea met with a serious set-back. Prussia's victory forced Austria to come to terms with the Magyars: and the bargain was sealed by the *Ausgleich*, or Dual System, at the expense of the lesser nationalities. Within certain limits Croatia's autonomy was respected, but so far from Zagreb being consulted, the terms of the new settlement were in effect dictated from Budapest and only submitted *pro forma* to a carefully "packed" Croatian Diet, after the bargain between Budapest and Vienna had already made of them an accomplished fact. Meanwhile the murder of Prince Michael in the same year deprived Serbia of a great statesman and the movement for unity of a possible head. During the 'seventies Austro-Hungarian policy was increasingly successful in checking intercourse between the Yugoslavs of the monarchy and those outside its bounds. Meanwhile the newly constituted "Party of Right," resting upon a narrow Catholic clerical basis, aimed at the reunion of Dalmatia with Croatia-Slavonia in the so-called Triune Kingdom, within whose bounds it affected to deny the very existence of Serbs. This Pan-Croat ideal was favoured in Vienna as a convenient rival to Pan-Serbism, with its centre in Belgrade; but its natural effect was to drive the Serbs of Slavonia and S. Hungary into the arms of Budapest. The insurrection of Bosnia against the Turks only served to increase party discords: for though it aroused the keenest sympathy of all Serbs and Croats, and thus furthered the sense of racial affinity, it gave rise to rival claims upon Bosnia which could be exploited in the interest of Vienna and Budapest. The official policy of Baron Kállay, for 20 years the administrator of Bosnia, was to taboo the name of Serb in the hope of creating a distinct "Bosnian" nationality.

The period between 1883 and 1903 is the most humiliating in the modern history of the southern Slavs. Count Khuen-Hederváry, as Ban of Croatia, reduced political corruption to a fine art and governed by playing off Croat and Serb against each other, and fanning the dying flames of religious bigotry:

while at the same time Serbia under King Milan was reduced to the position of a mere satellite of Vienna. The humiliating secret treaty concluded between Austria-Hungary and Serbia in 1881 had specially pledged the latter to repress any nationalist agitation against the Dual Monarchy, even in respect of that Bosnia for which Serbia had risked her existence four years earlier. Disunion had reduced the Yugoslavs to an almost negligible quantity in Balkan politics.

The National Revival in Croatia.—After the turn of the century, however, a new generation arose both among Croats and Serbs, which had received its education abroad, and especially in Prague, where the ethical and political teachings of Prof. Masaryk exercised a remarkable influence over the progressive youth of all Slav countries. All thinking men were increasingly conscious that no progress was possible until Croat and Serb presented an united front against German-Magyar predominance. The first signs of reviving solidarity came in 1903, when Khuen's rigorous suppression of rioting in Zagreb and several country districts of Croatia, led to demonstrations of protest throughout Dalmatia and Istria. Thirty Croat deputies of those provinces resolved to lay their kinsmen's grievances before the Emperor, and his refusal of an audience played a material part in alienating Croat sympathies from the Crown. It is not unstructive to note that as the same year 1868 witnessed a set-back in both Croatia and Serbia, so the same year 1903 marks a parallel revival in national consciousness in both countries, coincident with the fall of Khuen-Hederváry and the removal of the Obrenović dynasty. Abroad the new King's position was prejudiced by the hideous crime which led to his accession, but among his own people this was from the first atoned for by the introduction of a real constitutional régime and increased political stability. The Serbian court, instead of being a centre of perpetual scandal and misrule, resumed its true position as a focus of national aspirations, and this change was not lost upon the Yugoslavs of "the other side."

Resolution of Fiume.—The advocates of political coöperation between Serb and Croat saw their opportunity in the constitutional conflict which broke out between Crown and Parliament in Hungary: and on Oct. 4 1905 40 Croat deputies from Croatia, Dalmatia and Istria formulated in the so-called "Resolution of Fiume" a complete programme of political reform, and defined the basis upon which solid friendship between Croats and Magyars seemed attainable. The prime movers in this action were Dr. Trumbić, a leading Dalmatian advocate and mayor of Spalato, and Mr. Supilo, also a Dalmatian, the editor of the *Novi List* at Fiume. Ten days later 26 Serb deputies from the various provinces of the monarchy, met at Zara, indorsed the principles embodied in the Resolution of Fiume and declared in favour of joint political action between Croats and Serbs. It is worthy of note that the Resolution of Fiume anticipated the modern doctrine of self-determination by the very explicit assertion that "every nation has the right to decide freely and independently concerning its existence and its fate." On Nov. 14 the Croat and Serb parties in the Diet of Dalmatia publicly affirmed the principle that "the Croats and Serbs are one nation": and this standpoint has never since been abandoned. The Serbo-Croat coalition, formed on the basis of the Fiume Resolution, at once acquired the mastery in Croatia, and even when its short-lived alliance with the Hungarian coalition—in power in Hungary since April 1906—was replaced by acute conflict in the summer of 1907, no amount of repression from Budapest could destroy its solid majority in the Croatian diet. Baron Paul Rauch, the Magyar nominee as Ban, failed, with all his official apparatus, to secure a single seat for his creatures at the general election of 1908, and therefore proceeded to govern without Parliament, by an elaborate system of administrative pressure, press persecution and espionage. Under his régime Magyar intolerance of Croat national aspirations joined hands with the designs of the Ballplatz against Serbia in connexion with the impending annexation of Bosnia.

Friedjung Trial.—The treason trial which opened at Zagreb in March 1909 pursued the parallel aims of intimidating the

Serbs of Croatia, of splitting the new-found unity of Serb and Croat and of proving to the outside world the existence of a dangerous Pan-Serb movement organized from Belgrade inside the monarchy and amply justifying the countermove of annexation. None of these aims were attained; for the trial, which turned on the evidence of the police spy Nastić (already chief witness in the doubtful Cetinje bomb trial of 1908) degenerated into a public scandal, owing to the conduct of the judges and public prosecutor, and rallied Croat public opinion in defence of the 53 Serb victims. Serbo-Croat solidarity became still more apparent when the Austrian historian Dr. Friedjung, in the *Neue Freie Presse* of March 25 1909, openly charged the leaders of the Serbo-Croat coalition with being in the pay of Serbia. This article, which was based upon a mass of incriminating documents supplied to Friedjung by the Austro-Hungarian Foreign Office, had been timed to coincide with the outbreak of hostilities against Serbia, and was to have been the first of a series convicting the Serbian Government and dynasty of aggressive and even murderous designs. When at the last moment war was averted by the surrender of Serbia and Russia, an attempt was made to withdraw the article, but the first copies had already been issued; and Count Aehrenthal now had the double embarrassment of the Zagreb trial, which no longer served any purpose of foreign policy, but suited the aggressive game of Budapest against Zagreb, and of a libel action brought against Friedjung by those leaders of the Serbo-Croat coalition whose honour he had impugned. Despite the Ballplatz's efforts at postponement, the trial took place in Vienna in Dec. 1909, and revealed the documents upon which Friedjung had relied, as impudent forgeries concocted by subordinate officials of the Austro-Hungarian legation in Belgrade, with the connivance of the minister, Count Forgács. The responsibility was finally brought home to Forgács by Prof. Masaryk in a famous speech before the Austrian delegation; and Aehrenthal preserved an embarrassed silence when his minister was bluntly compared with Azev, the Russian *agent provocateur*.

The Cuvaj Dictatorship.—The triumphant vindication of Mr. Supilo and his colleagues of the Serbo-Croat coalition gave a fresh incentive to the idea of unity throughout the southern Slav provinces of Austria-Hungary. Rauch's position had become untenable, and he was succeeded by the more moderate Dr. Tomásić, who brought with him from Budapest the concession of a somewhat extended franchise (260,000 instead of 50,000 electors). His attempt to emancipate himself from the control of the coalition at the general elections of Oct. 1910 failed miserably, and after a year of temporizing, he suddenly threw off all pretence at legal forms, dissolved the Diet almost before it had met, and in Dec. 1911 ordered new elections. But in spite of wholesale terrorism he only succeeded in wrenching five more seats from the coalition, and on Jan. 19 1912 was replaced as Ban by a little known official Mr. Cuvaj, who promptly dissolved the Diet before it had even met, and proceeded to muzzle the press, to close the university and to arrest several prominent politicians. On April 3 the Croatian constitution was completely suspended by royal decree, and Cuvaj invested with far-reaching dictatorial powers. An attempt on his life by the student Jukić (June 8) was followed by still more reactionary measures, and on July 11 the autonomy of the Serbian orthodox church in Slavonia and Hungary was also suspended.

The Cuvaj régime had a magical effect in furthering the movement for Yugoslav unity. Specially significant were the Memorandum addressed to the throne by 55 deputies of the Croat party of Right, in the Croatian, Bosnian, Dalmatian and Istrian Diets, and the political strike organized by the pupils of both sexes in almost all the middle schools of the Slavonic South. This gave rise to sympathetic demonstrations in many Dalmatian and Bosnian towns, and to a series of interpellations and speeches by the Yugoslav and Czech deputies in the Parliament of Vienna. The Slovenes—clericals no less than progressives—became increasingly active in the Yugoslav movement, and their press began to demand the abandonment of the distinctive Slovene dialect as a hindrance to unity.

Balkan War.—It was peculiarly unfortunate for Austria-Hungary that the Cuvaj régime should have been at its very height when the Balkan League achieved its dramatic victory over the Turks. The battle of Kumanovo in particular was greeted with indescribable enthusiasm throughout the Yugoslav provinces. The Serbian and Bulgarian anthems were sung on the streets, collections were made in every village for the Balkan Red Cross funds, and when Austria-Hungary mobilized, protests were heard on every side against the bare possibility of war with Serbia, which to the Yugoslavs would be a veritable civil war. The Austrian Government committed the grave blunder of answering these demonstrations by press confiscations and by the dissolution of the town councils of Spalato and Sebenico. This, however, was promptly countered by a monster meeting of protest at Zara on Nov. 24, attended by all but three of the Serbo-Croat deputies of Dalmatia, and delegates of almost every municipality in the province. Doctor Drinković, leader of the Dalmatian clericals, openly declared that "in the Balkan sun we see the dawn of our day!" and the Catholic Bishop of Cattaro greeted the news from Monastir by reciting the *Nunc Dimittis*. On all sides Serbia was now regarded as the southern Slav Piedmont; and the Dual Monarchy's consistently hostile policy toward Belgrade, and its only too successful efforts to set Serbia and Bulgaria by the ears, intensified the excitement and resentment among its Yugoslav subjects. The Trialist solution (which would have united the Yugoslav provinces of Austria-Hungary in a third state enjoying equality with the two existing partners) rapidly lost popularity, even among the clerical parties, which had been attracted by the prospect of Catholic predominance in such a State.

On Dec. 27 1912 Cuvaj was replaced by a colourless official, Dr. Unkelhäusser, who marked time until a fresh candidate for the post of commissary or dictator was forthcoming in the person of Baron Skerlecz (July 23 1913). This appointment, at a moment when Austria-Hungary was again contemplating war with Serbia, naturally increased the ferment, and on Aug. 18, a determined attempt was made upon the life of Skerlecz by a young American Croat. At length on Nov. 30 Skerlecz was made Ban, the illegal decrees of Cuvaj revoked, and general elections ordered—the fifth since 1906. The coalition maintained its majority, the Government only obtaining ten seats; but though this time the Diet was allowed to meet, no attempt was made to satisfy Yugoslav aspirations or to solve the real issues at stake between Hungary and Croatia. More and more the situation in the south of the monarchy was allowed to drift. The political leaders were far more conscious than either Vienna or Budapest of the volcanic state of public opinion; but when in genuine alarm and from a sense of impotence they attempted to restrain their followers, the only result was a loss of influence over the younger generation, which had become increasingly infected by revolutionary ideas. Among the Yugoslavs the students had always dabbled unduly in politics, and this tendency was accentuated by the widespread unrest and excitement which followed upon the Balkan upheaval. On the eve of war the university and middle-school students had five or six newspaper organs of their own—notably *Jugoslavija* in Prague, *Val* in Zagreb and *Jedinstvo* in Spalato—which advocated more radical action alike in politics and literature. Nor is it surprising that the hotheads among them, fired by the example of Jukić and other would-be assassins of Varesanin, Cuvaj and Skerlecz, should have indulged in terrorist projects. From this group came the young Bosnian Serb students Princip, Čabrinović, Grabež and others, who murdered the Archduke Francis Ferdinand and the Duchess of Hohenberg at Sarajevo on June 28 1914, and thus lit a spark in the European powder magazine.

The World War.—Immediately on the outbreak of the World War measures of extreme severity were taken by the civil and military authorities of Austria-Hungary throughout their Yugoslav provinces. The exact number of persons arrested or interned will probably never be known, but that the Yugoslavs were regarded, and treated, as a hostile population, is abundantly proved by the three following facts, which could be mul-

tiplied indefinitely. Doctor Tresić-Pavičić, the Dalmatian-Croat deputy, was informed by one of the judges who examined him that over 5,000 had been imprisoned in Dalmatia, Istria and Carniola. In the single internment camp of Arad there were 3,400 deaths among the victims from Bosnia alone; and Father Nikolić, a Catholic priest from Istria, testified to having himself buried over 2,000 Istrian victims, and Doctor Martinović to a knowledge of 8,000 fatal cases in the Styrian camps. In Dalmatia the leading deputies (e.g. Smolaka, Čingrija, Tresić, Drinković) and many priests, advocates, doctors and other intellectuals were arrested, some being used as hostages and forced to accompany railway patrols, under the threat of instant death in case of sabotage by the population. All the municipal councils in Dalmatia (with the solitary exception of Zara, which had an Italian majority) were dissolved at an early stage in the war. Among the Slovenes of Istria and Carniola there were also numerous arrests, and the *Matice Slovenska*, the chief Slovene literary society, was dissolved and its funds confiscated. Press censorship was of course very rigid throughout the Dual Monarchy, but many Yugoslav newspapers were suppressed altogether. It was perhaps natural that repression should be specially severe in Bosnia. There were wholesale internments, conducted with the utmost brutality; and the horrors of the camps of Doboj, Mostar, Arad, Thalerhof, Müllersdorf, Gmünd, were early in 1918 revealed by Doctor Tresić in the Austrian Reichsrat. After the Archduke's murder the headquarters of various Serbian institutions in Sarajevo had been sacked by mobs, with the open connivance of the police: after the outbreak of war practically all Serb societies and schools were closed in Bosnia. At a later stage the Orthodox calendar and the Cyrilline alphabet were prohibited, and this was actually enforced in Serbia itself during the Austrian occupation, and in the Serbian districts of Hungary from July 1916 onward. Bosnia was also the scene of a succession of monster political trials. In March 1915, 28 schoolboys of Banjaluka were sentenced to terms varying from two years to four months for founding a local Yugoslav society. In July 65 schoolboys from Sarajevo and Travnik received similar sentences, and again in Oct. 38 more boys from Tuzla were condemned to a total of 156 years. In Nov. 1915 at Banjaluka 151 prominent Bosnian Serbs—including 5 deputies and 20 orthodox priests—were put on trial for treason: and eventually 16 death sentences were passed, and terms of imprisonment totalling 858 years and a collective fine of 14 million crowns, were passed. Worse even than this was the system of wholesale expatriation adopted as a punishment for those who had shown a friendly attitude to the invading Serbian army. During the spring of 1915 the official organ at Sarajevo published list after list of Bosnian-Serb families who were thus declared to have forfeited their citizenship: and many thousands of women and children were driven across the Montenegrin frontier, often with only the clothes in which they stood. The motive was avowedly the same which in the Middle Ages led a mediæval garrison to drive the civil population of a town into the camp of its would-be deliverers. With every year of war the number of confiscations of property increased in the Yugoslav provinces, as in Bohemia and Transylvania—vengeance upon the families at home being widely used in order to deter Slav, Italian or Rumanian prisoners from enlisting in the various volunteer corps in process of formation on the Russian, Balkan and Italian fronts. In Croatia alone was there even a semblance of constitutional government. The diet of Zagreb was allowed to meet, and the Serbo-Croat coalition pursued a policy of pure opportunism, avoiding any pronouncement on matters of high policy, but buying a certain relaxation of régime in Croatia by supporting the Budapest Government and its nominee Skerlecz. But even this subservient and cautious House sometimes asserted itself: and on one occasion its vice-president Doctor Magdić proclaimed "the nation's constant desire for unification in a single and independent political body."

Yugoslav Propaganda Abroad.—Meanwhile a certain number of Yugoslav leaders had managed to reach foreign soil before the outbreak of war, and during the winter of 1914 constituted

themselves as the Yugoslav Committee. Its two foremost leaders were Doctor Trumbić and Mr. Supilo (two of the makers of the Resolution of Fiume) and it also included Doctor Hinković (known as the chief advocate in the Zagreb treason trial), Ivan Meštrović the sculptor, the Slovene deputies Gregorin and Trinajstić, the Bosnian Serb deputies Stojanović, Srđić and Vasiljević, publicists of repute such as Marjanović and Banjanin, and prominent representatives of the Yugoslav colonies in North and South America, such as the scientist Pupin and the shipping magnate Baburica. Their original centre was Rome, but in view of the hostile attitude of the Salandra-Sonnino Government they transferred their activities to Paris and London early in 1915. They were in close and cordial contact with the Serbian Government, but rightly insisted on retaining entire independence of action, their funds being derived from their wealthy S. American supporters, who had long been enthusiasts for the Yugoslav idea. Their first public pronouncement was an appeal to the British Parliament and nation (May 1915) for sympathy with the cause of Yugoslav unity and the dissolution of Austria-Hungary. This formed a natural complement to the unanimous declaration of the Serbian Skupština in Dec. 1914 for a union of Serbs, Croats and Slovenes in one State.

Secret Treaty of London.—The entry of Italy into the war was a serious set-back to the Yugoslav cause, for under the Treaty of London (April 27 1915) she was to obtain, in the event of an Entente victory, wide districts in Gorizia, Carniola, Istria and Dalmatia, peopled by not less than 700,000 Yugoslavs. The frontier was to follow the watershed of the Julian Alps from Tarvis as far east as the Snježnik (Schneeberg) and to reach the sea just east of Volosca, Fiume being expressly reserved to Croatia. To Italy was assigned the northern half of the Dalmatian mainland as far as Cape Planka, and all the islands save Krk (Veglia) and Rab (Arbe) in the N., Solta and Braza in front of Spalato, and the few which lie to the south of Meleda. The jealously guarded secret was discovered by Mr. Supilo in Petrograd within a few days of the signature of the treaty, and the main facts becoming known in Austria-Hungary, were skilfully exploited by her to rally the Croats and Slovenes in defence of their national territory. It was easy to represent the Entente as having betrayed the interests of Serbia and her kinsmen: and as for a time the Pašić Cabinet, in deference to the narrowly Orthodox influences then all powerful at Petrograd, was prepared to limit its claims to the mainly Serb and Orthodox provinces of Bosnia and Slavonia, and to leave the Catholic Croats and Slovenes to their fate, there was during the summer a certain revulsion of feeling in favour of Austria-Hungary, who appointed a Serb Orthodox frontiersman (Graničar), General Borojević, to the chief command on the Isonzo front. The conquest of Serbia, however, once more closed the ranks of the Yugoslavs, who saw in unity their sole hope for the future: and the desertions to the Entente which were so marked a feature of the first winter, became so rife as to render necessary a drastic revision of the Austro-Hungarian regimental system. Henceforth the various corps lost more and more their territorial character, one nationality was set to watch and control the other, and espionage and delation prevailed.

The Yugoslav Legions.—During the winter of 1915 delegates of the Yugoslav Committee, with the Tsar's special permission, began enrolling volunteers from among the prisoners on the Russian front; and by March 1916 a division of 23,000 men had been concentrated at Odessa, and a second was formed later. Serbian officers under General Živković were sent out, and many officers of the future Czechoslovak legions first saw service in this corps. The Yugoslavs greatly distinguished themselves during the Dobruja campaign (Nov. 1916), and their wounded shot themselves or each other on the battle-field, rather than fall as traitors or deserters into the hands of Austria. It was with this corps that Dr. Elsie Inglis and a detachment of the Scottish Women's Hospitals served as medical unit. After the Russian collapse most of the survivors were gradually drafted through Murmansk, England and France to the Salonika front: one brigade was cut off by the Bolshevik Revolution and had to be

evacuated through Siberia. In 1916 the Yugoslav Committee had also set itself to recruiting among its compatriots in America, but in this case its success was hampered by many cross currents of republican, clerical, Austrian and Montenegrin feeling: and those who did actually volunteer showed considerable lack of discipline and were not always treated with the necessary tact by the Serbian military authorities.

The Yugoslavs inside Austria-Hungary.—The accession of the Emperor Charles, and the ferment aroused by the Russian Revolution, led to considerable political changes in both halves of the Dual Monarchy, the most notable being the dismissal of Count Tisza from the Hungarian premiership (May 23 1917), the grant of a general political amnesty, and the summons of the Austrian Reichsrat, which had not been allowed to meet since March 1914. No sooner was political life thus resumed than all the Slovene, Croat and Serb deputies of Austria united to form a "Yugoslav parliamentary Club," which entered into close alliance with the Czech Club. At the opening sitting (May 30) Czechs, Poles and Ruthenes defined their national attitude in formal resolutions, and the Slovene leader, Father Korošec, in the name of the Yugoslavs, demanded "the union of all the Yugoslav territories of the Monarchy in an independent state organism, free from the rule of any foreign nation, and resting on a democratic basis, under the sceptre of the Habsburg-Lorraine Dynasty." The last phrase was treated in some quarters as a proof of confirmed Austrophilism: in reality it was a minimum concession to the existing order, without which its framers could not have continued their activity. By this time it was sufficiently obvious that the Yugoslavs were tacitly if not explicitly agreed upon a triple parallel policy, framed for all contingencies. In Croatia the coalition was more opportunist than ever, and sent its delegates to the coronation of Charles as King of Hungary: by its compliance it obtained the appointment of its own nominee, Mr. Mihalović, as Ban, and was thus able to husband Croatian resources and on occasion to practise passive resistance. It accepted the *status quo* as a working basis, but no amount of pressure could wring from it a disavowal of Trumbić and his colleagues. Meanwhile the opposition parties openly allied themselves with the Yugoslav Club in Austria, which agitated for complete national unity, but saved itself from prosecution by occasional references to the dynasty and absolute silence regarding Serbia. It was left to the Yugoslav Committee abroad to claim independence as well as unity, to repudiate the Habsburgs (in a manifesto on the eve of the Budapest coronation) and to exalt the achievements of Serbia and the Karagjorgjević dynasty. The three groups communicated secretly through Switzerland, and it was felt that the time had come for the exiles to take a fresh step forward, in view of the prominence given to the doctrine of self-determination since the Russian Revolution and America's entry into the war. Moreover the collapse of Tsarism had deprived Mr. Pašić of his strongest support abroad, and forced him to abandon his narrowly Orthodox basis and bring his policy more into line with modern democratic tendencies.

Declaration of Corfu.—After some weeks of negotiation the so-called "Declaration of Corfu" was signed on July 20 1917, between Pašić as Serbian Premier (and in this case as the mouthpiece of all the Serbian parties) and Dr. Trumbić as president of the Yugoslav Committee. The signatories were careful to disclaim all idea of a pact or treaty, and to define the declaration as a mere statement of ideals and principles which could not acquire binding force until ratified by elected representatives of the nation as a whole. It may however be regarded as the birth certificate of the future Yugoslavia, and as fixing the lines of future development. After affirming that the Serbs, Croats and Slovenes constitute a single nation and appealing to the right of self-determination, it declared in favour of complete national unity under the Karagjorgjević dynasty, "a constitutional democratic and parliamentary monarchy, equality of the three national names and flags, of the Cyrilline and Latin alphabets, and of the Orthodox Catholic and Mussulman religions, equal rights for all citizens, universal suffrage in parliamentary and

municipal life, and the freedom of the Adriatic to all nations." The future constitution was to be established after the conclusion of peace by a constituent assembly, which "will be the source and consummation of all authority in the State." A week later Trumbić and his colleagues were welcomed on the Balkan front by the Voivode Mišić with an impassioned speech in favour of unity. The Declaration of Corfu made a profound impression in Austria-Hungary, which was heightened by Mr. Lloyd George's speech in honour of Serbia at a luncheon given by the Serbian Society of Great Britain to Pašić (Aug. 8). The Zagreb press could only comment indirectly, but conveyed its meaning by insisting that the Reichsrat programme of May 30 was an absolute minimum. The growing self-confidence of the Austrian Slavs was shown by the bluntness of their refusal to coöperate with the new Premier, Doctor von Seidler, whose offer of portfolios to their leaders drew from Count Tisza a strong protest in the Hungarian Parliament. Under Magyar pressure Seidler explicitly condemned all schemes of federalism, and pledged the Government and even the crown itself not to adopt any reforms which did not leave untouched the existing provincial boundaries. The Czechs and Yugoslavs, finding the door thus shut in the face of their national aspirations, even in the modified Habsburg form, naturally stiffened in their opposition. On Dec. 18 they went so far as to demand national representation of their own at the peace negotiations with Bolshevik Russia at Brest Litovsk.

Pact of Rome.—During 1916-7 Italian public opinion, encouraged by Sonnino and his press organs, had been definitely hostile to the Yugoslavs, whom it denounced as mere Austrian agents. The facts regarding the Yugoslav legions and the services rendered by Yugoslav deserters at Gorizia and in the Trentino were simply suppressed. The disaster of Caporetto (Nov. 1917) had a sobering effect, and the need for solidarity on the part of all the subject nationalities of Austria-Hungary,—a category which included also Italians,—if Italy's chief enemy was to be overthrown, became increasingly apparent. Further causes for alarms were the secret meeting between General Smuts and Count Mensdorv, to discuss a separate peace between Austria and the Entente (Dec. 1917) and the public pronouncements of President Wilson and Mr. Lloyd George in favour of "autonomy" for the subject races, instead of the independence held out to them by the Allied pronouncement of Jan. 1917. In Dec. 1917 Mr. Wickham Steed succeeded in bringing together Trumbić and his colleagues first with General Mola and Signori Emanuel and Chiesi (of the *Corriere* and *Secolo*), and then with the Italian Irredentist Socialist leaders. Their informal discussions laid the basis for more serious negotiations between Trumbić and Signor Torre, representing an influential committee of Italian deputies and senators. The agreement signed between them in London on March 7 1918 laid down the basis of Italo-Yugoslav coöperation: it recognized each of the two nations to be equally interested in the completion of the other's national unity, and in the liberation of the Adriatic. It left territorial questions to be decided amicably after the war, "on the basis of the principle of nationality and self-determination," and mutually guaranteed the rights of national minorities. This agreement is known as the Pact of Rome, because it was publicly proclaimed at a "Congress of the Oppressed Nationalities of Austria-Hungary," held on April 8 in the Roman Capitol. The Yugoslavs were represented by Trumbić and his Committee and by 12 deputies of the Serbian Skupština, the Czechoslovaks by Beneš and Štefanik, the Poles by Zamorski, Skirmunt and Seyda, the Rumanians by Draghicescu, Lupu and Mironescu. Baron Sonnino held aloof, but Premier Signor Orlando, greeted the congress with enthusiasm, and the first result was a combined propaganda on the Italian front, organized by Allied delegates and members of all the national committees. The effect of the congress and of this propaganda was to hasten the disintegration in the Austro-Hungarian army, and the High Command (in a communiqué of July 27) admitted that wholesale defections of the Czechoslovaks and the Yugoslavs had materially contributed to Italy's brilliant stand against the

last Piave offensive in June. Unfortunately, while the new Czechoslovak army was recognized by Italy and took its place in the front line, Baron Sonnino, for political reasons, vetoed the formation of similar Yugoslav legions, though General Diaz had consented, and though the Yugoslavs interned at Nocera and elsewhere were clamouring to be enrolled.

Collapse of Austria-Hungary.—Meanwhile the Roman congress was deliberately imitated by an imposing congress at Prague (May 16), at which Czech, Polish, Italian, Rumanian, Slovak and Yugoslav delegates attended. Among the latter were the mayor of Zagreb, the poet Vojnović, and prominent Serb, Croat and Slovene deputies of all parties, including the peasant leader Stephen Radić and the future minister Pribičević. Their resolutions, though necessarily vague, amounted to a pledge of mutual support in the cause of unity and independence. During 1918, the initiative among the Yugoslavs of the Monarchy fell more and more into the hands of the Slovenes, led by Father Korošec since the premature death of Monsignor Krek. The official recognition accorded to the Pact of Rome by Mr. Lansing in the name of America (May 31) was a fresh encouragement: and Korošec, after constituting a Yugoslav National Council for the furtherance of unity, convoked a new Slav congress at Lyublyana (Ljubljana) on Aug. 18. The demonstrative part taken by the prince-bishop Jeglič and the leading Catholic clergy, and the fact that the Emperor's birthday was entirely disregarded, was intended as an answer to those who claimed the Slovene Catholics as a bulwark of the Habsburg throne. The central authority in Austria was steadily breaking down, and the food crisis was rendered still more acute by the widespread formation of "Green Cadres"—well organized armed bands which held positions in the mountains and defied capture. As early as Feb. a mainly Yugoslav revolutionary committee had almost gained control of the Cattaro naval base, which would have fallen into Entente hands if the ringleaders, who crossed the Adriatic for help, had not been detained by subordinate Italian subordinates until the Pola squadron had time to crush the mutiny. Moreover the High Command viewed with alarm the growth of "Septembriist" doctrine among the troops—i.e. the insistence upon "peace by September" and a refusal to face a fifth winter in the trenches.

During the late summer the authorities in Vienna and Budapest keenly debated rival plans for solving the southern Slav question—in every case, however, in accordance with Austrian or Hungarian rather than Yugoslav interests. Strangely enough the only attempts to consult the Yugoslavs themselves were an audience to which the Emperor Charles summoned Father Korošec and a journey undertaken by Count Tisza in Sept., with the crown's approval, to Zagreb, Sarajevo and Dalmatia. This last attempt to win support for the Magyar solution was everywhere met with a blank refusal, and in Bosnia especially the Orthodox, Catholic and Moslem leaders united in a manifesto assuring him of their adherence to the full programme of Yugoslav unity. The surrender of Bulgaria (Sept. 30) naturally rendered the nationalities indisposed to concessions, and the Austrian Premier's admission that national autonomy was now inevitable was icily received. The Czech and Yugoslav spokesmen in the Reichsrat insisted upon separate representation at the peace negotiations, and the absolute right to decide their own future State allegiance (Oct. 1).

Events now followed each other with lightning speed. On Oct. 4 Austria-Hungary, in a note to America, accepted President Wilson's speeches as a basis of discussion, and on the 8th Baron Hussarek admitted that the Monarchy's internal structure must be modified, and "full-grown nations" determine their own future. This only precipitated the collapse, and while Count Tisza voiced Hungarian public opinion in declaring the basis of the Dual system to be shattered, the Yugoslav National Council was transplanted from Ljubljana to Zagreb and strengthened by the inclusion of representatives of all parties (Oct. 20). On the 26th the Hungarian Government declared in favour of personal union, and that day Hussarek published an imperial proclamation, dividing Austria (not Austria-Hungary)

into four federal units (German, Czech, Yugoslav and Ukrainian) and leaving the Poles to make their own decision. This project was stillborn and pleased no one. Korošec in the name of the Czech and Yugoslav Clubs unreservedly rejected it and claimed that the future of both nations was an international problem which only the future Peace Conference could solve. Henceforth the Yugoslavs acted independently of both Vienna and Budapest: and when on Oct. 31 the news of President Wilson's answer to Count Burián's final peace note (refusing to negotiate save on the basis of a recognition of Czechoslovak and Yugoslav national claims) became generally known, the old régime vanished almost as if by magic. Extraordinary scenes took place in many towns, the troops tearing off their military badges with the Habsburg arms, and trampling them underfoot. National councils were speedily formed in Dalmatia and Bosnia, which arranged for the disarmament of the troops pouring northward from the broken Albanian and Macedonian fronts. As early as the 23rd a Croat regiment stationed in Fiume disarmed the Magyar militia and took possession of the town. On the 24th Count Andrássy was appointed joint foreign minister, but the machinery of State had ceased to work, and both the Austrian and Hungarian Cabinets were in *statu demissionis*. On the 28th (the same day on which the Czechoslovak Republic was born in Prague) the military command in Zagreb handed over its authority to the National Council, and next day the diet proclaimed the independence of Croatia from Hungary, and assumed control of Fiume. The arsenals of Pola and Cattaro were already in the hands of the insurgents; and the Emperor Charles, in the hope either of winning the favour of the new régime in Zagreb or of throwing an apple of discord between it and the Entente, signed a decree on Oct. 31 making over the whole Austro-Hungarian fleet to the Yugoslav State. This was not unnaturally interpreted by the Italian Nationalists as a proof of collusion between Zagreb and Vienna; nor was it generally known that as early as Oct. 4 Štepanek and Giunio, as delegates of the Czech and Yugoslav revolutionary committees, reached Italy in a fishing-boat, to concert with the Allies a general rising along the coast, but were closely imprisoned in Rome and not allowed to communicate with Doctor Beneš and Doctor Trumbić till nearly three weeks had been lost. But for this delay before the fleet might have been in the Entente's hands a fortnight before the final Italian offensive opened on the Piave. Unhappily every step led to a fresh misunderstanding. The action of the Supreme Council in Paris in prescribing the frontier line of the secret treaty of London as the line of occupation under the Austro-Hungarian armistice was keenly resented by the Yugoslavs as a breach with Wilsonian principles. The Allies very properly insisted that the fleet must be surrendered into their hands, but before this could take place a deplorable incident occurred in Pola harbour, the "Viribus Unitis" being blown up by an Italian mine, with a Yugoslav admiral and crew on board. In Italy Baron Sonnino's frankly anti-Slav attitude threw the Pact of Rome into the shade: and the Consulta worked hard to prevent Yugoslavia's recognition by the Allies.

Rival "Great Serb" and "Yugoslav" Programmes.—That this recognition had not already been accorded before the collapse of the Central Powers began was due to disunion among the Yugoslavs themselves. During the summer America gave a lead to the Allies by accepting the Yugoslav programme, and after Austria's failure on the Piave there was a growing disposition on the part of the western Powers to fall into line with Mr. Lansing's very clear pronouncements. But Pašić, free from the restraints of a coalition and from all parliamentary control, had reverted to his original pan-Serb standpoint, and steadily declined to reconstruct his Cabinet on a wider Yugoslav basis. Trumbić on his part could not enter a purely Serbian Cabinet without prejudicing that freedom of choice of his compatriots in the Dual Monarchy, upon which the moral case of the Yugoslavs depended. A series of incidents proved the difference of outlook to be not merely personal but fundamental. In July Mr. Mihajlović, the Serbian minister at Washington, was summarily dismissed by Pašić, the reason being his refusal as a good

evacuated through Siberia. In 1916 the Yugoslav Committee had also set itself to recruiting among its compatriots in America, but in this case its success was hampered by many cross currents of republican, clerical, Austrian and Montenegrin feeling: and those who did actually volunteer showed considerable lack of discipline and were not always treated with the necessary tact by the Serbian military authorities.

The Yugoslavs inside Austria-Hungary.—The accession of the Emperor Charles, and the ferment aroused by the Russian Revolution, led to considerable political changes in both halves of the Dual Monarchy, the most notable being the dismissal of Count Tisza from the Hungarian premiership (May 23 1917), the grant of a general political amnesty, and the summons of the Austrian Reichsrat, which had not been allowed to meet since March 1914. No sooner was political life thus resumed than all the Slovene, Croat and Serb deputies of Austria united to form a "Yugoslav parliamentary Club," which entered into close alliance with the Czech Club. At the opening sitting (May 30) Czechs, Poles and Ruthenes defined their national attitude in formal resolutions, and the Slovene leader, Father Korošec, in the name of the Yugoslavs, demanded "the union of all the Yugoslav territories of the Monarchy in an independent state organism, free from the rule of any foreign nation, and resting on a democratic basis, under the sceptre of the Habsburg-Lorraine Dynasty." The last phrase was treated in some quarters as a proof of confirmed Austrophilism: in reality it was a minimum concession to the existing order, without which its framers could not have continued their activity. By this time it was sufficiently obvious that the Yugoslavs were tacitly if not explicitly agreed upon a triple parallel policy, framed for all contingencies. In Croatia the coalition was more opportunist than ever, and sent its delegates to the coronation of Charles as King of Hungary: by its compliance it obtained the appointment of its own nominee, Mr. Mihalović, as Ban, and was thus able to husband Croatian resources and on occasion to practise passive resistance. It accepted the *status quo* as a working basis, but no amount of pressure could wring from it a disavowal of Trumbić and his colleagues. Meanwhile the opposition parties openly allied themselves with the Yugoslav Club in Austria, which agitated for complete national unity, but saved itself from prosecution by occasional references to the dynasty and absolute silence regarding Serbia. It was left to the Yugoslav Committee abroad to claim independence as well as unity, to repudiate the Habsburgs (in a manifesto on the eve of the Budapest coronation) and to exalt the achievements of Serbia and the Karagjorgjević dynasty. The three groups communicated secretly through Switzerland, and it was felt that the time had come for the exiles to take a fresh step forward, in view of the prominence given to the doctrine of self-determination since the Russian Revolution and America's entry into the war. Moreover the collapse of Tsarism had deprived Mr. Pašić of his strongest support abroad, and forced him to abandon his narrowly Orthodox basis and bring his policy more into line with modern democratic tendencies.

Declaration of Corfu.—After some weeks of negotiation the so-called "Declaration of Corfu" was signed on July 20 1917, between Pašić as Serbian Premier (and in this case as the mouthpiece of all the Serbian parties) and Dr. Trumbić as president of the Yugoslav Committee. The signatories were careful to disclaim all idea of a pact or treaty, and to define the declaration as a mere statement of ideals and principles which could not acquire binding force until ratified by elected representatives of the nation as a whole. It may however be regarded as the birth certificate of the future Yugoslavia, and as fixing the lines of future development. After affirming that the Serbs, Croats and Slovenes constitute a single nation and appealing to the right of self-determination, it declared in favour of complete national unity under the Karagjorgjević dynasty, "a constitutional democratic and parliamentary monarchy, equality of the three national names and flags, of the Cyrilline and Latin alphabets, and of the Orthodox Catholic and Mussulman religions, equal rights for all citizens, universal suffrage in parliamentary and

municipal life, and the freedom of the Adriatic to all nations." The future constitution was to be established after the conclusion of peace by a constituent assembly, which "will be the source and consummation of all authority in the State." A week later Trumbić and his colleagues were welcomed on the Balkan front by the Voivode Mišić with an impassioned speech in favour of unity. The Declaration of Corfu made a profound impression in Austria-Hungary, which was heightened by Mr. Lloyd George's speech in honour of Serbia at a luncheon given by the Serbian Society of Great Britain to Pašić (Aug. 8). The Zagreb press could only comment indirectly, but conveyed its meaning by insisting that the Reichsrat programme of May 30 was an absolute minimum. The growing self-confidence of the Austrian Slavs was shown by the bluntness of their refusal to coöperate with the new Premier, Doctor von Seidler, whose offer of portfolios to their leaders drew from Count Tisza a strong protest in the Hungarian Parliament. Under Magyar pressure Seidler explicitly condemned all schemes of federalism, and pledged the Government and even the crown itself not to adopt any reforms which did not leave untouched the existing provincial boundaries. The Czechs and Yugoslavs, finding the door thus shut in the face of their national aspirations, even in the modified Habsburg form, naturally stiffened in their opposition. On Dec. 18 they went so far as to demand national representation of their own at the peace negotiations with Bolshevik Russia at Brest Litovsk.

Pact of Rome.—During 1916-7 Italian public opinion, encouraged by Sonnino and his press organs, had been definitely hostile to the Yugoslavs, whom it denounced as mere Austrian agents. The facts regarding the Yugoslav legions and the services rendered by Yugoslav deserters at Gorizia and in the Trentino were simply suppressed. Further causes for alarms were the secret meeting between General Smuts and Count Mensdorv, to discuss a separate peace between Austria and the Entente (Dec. 1917) and the public pronouncements of President Wilson and Mr. Lloyd George in favour of "autonomy" for the subject races, instead of the independence held out to them by the Allied pronouncement of Jan. 1917. In Dec. 1917 Mr. Wickham Steed succeeded in bringing together Trumbić and his colleagues first with General Mola and Signori Emanuel and Chiesi (of the *Corriere* and *Secolo*), and then with the Italian Irredentist Socialist leaders. Their informal discussions laid the basis for more serious negotiations between Trumbić and Signor Torre, representing an influential committee of Italian deputies and senators. The agreement signed between them in London on March 7 1918 laid down the basis of Italo-Yugoslav coöperation: it recognized each of the two nations to be equally interested in the completion of the other's national unity, and in the liberation of the Adriatic. It left territorial questions to be decided amicably after the war, "on the basis of the principle of nationality and self-determination," and mutually guaranteed the rights of national minorities. This agreement is known as the Pact of Rome, because it was publicly proclaimed at a "Congress of the Oppressed Nationalities of Austria-Hungary," held on April 8 in the Roman Capitol. The Yugoslavs were represented by Trumbić and his Committee and by 12 deputies of the Serbian Skupština, the Czechoslovaks by Beneš and Štefanik, the Poles by Zamorski, Skirmunt and Seyda, the Rumanians by Draghicescu, Lupu and Mironescu. Baron Sonnino held aloof, but Premier Signor Orlando, greeted the congress with enthusiasm, and the first result was a combined propaganda on the Italian front, organized by Allied delegates and members of all the national committees. The effect of the congress and of this propaganda was to hasten the disintegration in the Austro-Hungarian army, and the High Command (in a communiqué of July 27) admitted that wholesale defections of the Czechoslovaks and the Yugoslavs had materially contributed to Italy's brilliant stand against the

delegation, declined American arbitration and threatened to withdraw altogether from Paris unless their territorial demands were conceded. This in turn strengthened the hands of the extreme section among the Yugoslavs, who now advanced the full ethnographic claim, involving Trieste and Gorizia as well as Dalmatia and Istria, and at the same time increased their demands against Bulgaria, Austria and Albania. Nor was it very easy for the Serbs and Croats to show moderation toward Italy, without appearing to desert the Slovenes, at whose expense, for obvious geographical reasons, the main amputations must inevitably take place. The bad impression made by the claims now submitted to the Supreme Council was only partially removed by a speech of Trumbić and by his proposal to leave the settlement of frontiers to a plebiscite (April 16). This offer was made in the knowledge that the memorandum addressed by President Wilson two days previously to Orlando and Sonnino had met with rejection, and was indeed well calculated to heighten the contrast between the outlook of the two rival nations toward Wilsonian principles. The American note reaffirmed these principles as the accepted basis of armistice and peace, and insisted on applying the same methods toward Austria-Hungary as Germany. It accepted the Brenner as a fair strategic line on the north, but argued that the Treaty of London was no longer applicable in respect of Italy's eastern frontier, since the line which it traced was designed to secure Italy against future Austro-Hungarian aggression, and Austria-Hungary had by now ceased to exist. It then defined what came to be known as "the Wilson Line," which assigned to Italy Gorizia, Trieste and Istria west of the river Arsa, but not Fiume, which must become an international port, nor any points south of it, save perhaps Lissa and Valona: it also advocated the dismantling of the whole eastern Adriatic coast. On April 23 President Wilson followed up this private memorandum by a public manifesto to the Italian nation, in which he repudiated the Pact of London and appealed for the application of the same principles on the Adriatic as those enforced against Germany. Fiume, he declared, must be the outlet, not of Italy, but "of Hungary, Bohemia, Rumania and Yugoslavia." Unhappily, despite its warm assurances of American friendship, this document met with a most hostile reception in Italy, where it was interpreted as an attempt to undermine the position of her spokesmen and so mete out to her a different measure from that prescribed by France and Britain. Thus the proposal entirely failed of its effect, and as Italy, Yugoslavia and America each adhered to its standpoint, and the two western Powers shrank from any constructive policy, a fresh deadlock ensued. At the end of May, however, M. Tardieu suggested a compromise by which the port and district of Fiume with most of eastern Istria and a total population of over 200,000 (mainly Yugoslavs) would form a small buffer state between Italy and Yugoslavia, under the guarantee of the League of Nations. President Wilson adhered to his own scheme, but made it clear that he would not oppose any direct agreement, whatever might be its terms: while the Yugoslavs, though accepting the idea of a buffer state, insisted upon their enjoying at Fiume a status analogous to that of Poland at Danzig, and added the impossible condition of a plebiscite after three years. During the final stages of the German treaty the Adriatic problem was once more shelved, until on June 29 and July 6 armed conflicts took place in the streets of Fiume between Italian and French soldiers, resulting in several deaths. A commission of inquiry was then at last appointed by the Allies, and ordered elections under inter-Allied control and the dissolution of the terrorist "League of Volunteers." But on Sept. 12, the very day on which American and British police were to be installed, D'Annunzio and his Arditi occupied the town, with the open connivance of the Italian naval and military authorities though to the embarrassment of the Roman Cabinet. The Allies, so far from attempting to restore order, withdrew their forces and allowed their authority to be flouted. The fresh deadlock that ensued was by no means distasteful to Rome, which drew encouragement from Wilson's increasing impotence at home, and therefore

played for time. At last on Dec. 9 1919 the Supreme Council (Clemenceau, Polk and Crowe) addressed a memorandum to Italy, outlining new terms of settlement—viz. the Wilson line (modified so as to leave Albona in Italy), a demilitarized buffer state, a special régime for Zara, cession of Pelagosa, Lissa and Lussin to Italy: Valona in full sovereignty, and an Italian mandate in Albania, under the League of Nations. The Italian claim of territorial continuity with Fiume was definitely rejected. Italy in her reply (Dec. 10) insisted on continuity (the real if unavowed motive of which was to control the port of Fiume in the interests of Trieste and Venice, and so retain some hold over Yugoslavia's commercial development), demanded the island of Cherso and the neutralization of the Yugoslav coast, and suggested a triple division—the *corpus separatum* of Fiume to Italy, the port to the League of Nations, and the rest of the buffer state to Yugoslavia. On Jan. 6 1920 Nitti, meeting with no response, wrote to Lloyd George to demand the execution of the Pact of London. At this stage the Yugoslav delegation committed a grave tactical blunder, Trumbić's views being overridden by the Balkan imperialistic aims of Pašić. While pleading for a plebiscite against Italy and doing lip service to an independent Albania within the frontiers of 1913, it added that in the event of any revision of those frontiers Yugoslavia would claim Skutari and all territory north of the river Drin (Drim). The sole justification for such a claim lay in the terms of the Treaty of London, which the Yugoslavs could not adopt as a basis without stultifying their whole position against Italy. But Italy, in her next memorandum to the Conference (Jan. 9) thus found it easier to reaffirm the validity of the treaty, while arguing that as it had envisaged the creation of three separate states (Serbia, Montenegro and Croatia) rather than of a big Yugoslavia, the clause regarding Fiume could no longer be upheld. On Jan. 13 Clemenceau and Lloyd George addressed new proposals to the Yugoslavs, in the form of a scarcely veiled ultimatum. The buffer state was now abandoned, the *corpus separatum* (with territorial continuity) falling to Italy, Sušak to Yugoslavia and the port of Fiume to the League of Nations: Italy was also to receive Lussin, Lissa and the Albanian mandate, while Zara was to be independent under the League. In originating this impromptu scheme, Lloyd George was influenced by secret indications that the Serbian reactionaries, if promised Skutari in return for Fiume, might throw over Trumbić and abandon the Wilson Line and American principles generally. As however Trumbić rallied the Yugoslav delegation to refuse the Franco-British project, Clemenceau the very next day introduced the important modification that Fiume should be an independent state under the League. When the Yugoslavs placed various conditions upon their acceptance, they were bluntly informed that unless they accepted within four days, France and Britain would authorize the literal execution of the Treaty of London, thus leaving Fiume to Yugoslavia, but all northern Dalmatia in Italian hands (Jan. 20). But this ultimatum was rendered invalid by a wire from Lansing, protesting against any settlement without the participation of America. Paris and London having assured Washington that neither concealment nor lack of courtesy was intended, Belgrade found it quite safe to reject the note of Jan. 20, which it pointedly described as "a friendly proposal, not as an injunction." It further expressed its inability to believe that the Powers wished to impose "a treaty concluded unknown to it by third parties, and whose clauses have never been communicated to it." (Jan. 28.) This incident led President Wilson to address to the Allied Cabinets a series of three notes (Feb. 10 and 25 and March 6) which will remain the classic documents of the controversy, and reduced his opponents to silence, though not to surrender.

After their passage the Adriatic question was again allowed to stagnate, the Powers resuming their negative attitude, while advocating direct discussion between the two parties. At last on April 25 Trumbić, having obtained the special sanction of the Belgrade Cabinet, informed Nitti of his readiness to negotiate, and a meeting between the two statesmen did actually take place at Ballanza on May 12: the commercial experts had

already reached agreement. But the prospect of a settlement roused the Italian Nationalists to a final effort: the Nitti Cabinet fell, and D'Annunzio, repeating his defiance of Europe, attempted a further raid upon Dalmatia. The continued presence of American warships on the Dalmatian coast alone prevented a series of brawls between Italian sailors and the Croat population from developing into open warfare. Fortunately the new Giolitti and Vesnić Cabinets showed equal moderation and skill in restraining the hotheads on both sides, and the new Foreign Minister, Count Sforza, was assisted by a personal knowledge of Serbian and Balkan problems all too rare among western statesmen. It was not however till the autumn that direct negotiations could be resumed, and by that time the eclipse of President Wilson placed Italy at an advantage. By the Treaty of Rapallo (Nov. 12 1920) Italy acquired a frontier considerably farther east than the Wilson Line, and including the quicksilver mines of Istria, the watershed of the Julian Alps as far as Snježnik (*Monte Neoso*), almost all Istria with Abbazia and Volosca, and a narrow strip of shore connecting it with Fiume. The *corpus separatum* became an independent unit under the League of Nations, the Croat suburb of Sušak remaining in Yugoslavia and the Baros port being added as an outlet for Yugoslav trade. Zara became a free city under Italian sovereignty, but as a tiny isthmus without hinterland or islands. Italy renounced all claims to Dalmatia, and of the islands retained only Lussin and Cherso. Special linguistic and other privileges were assured to the Italian minority in the Dalmatian towns, but no corresponding charter was granted to the four to five hundred thousand Slovenes and Croats annexed to Italy. The settlement, though far from ideal, involved concessions on both sides: and Italy, though still forgetful of the principles enunciated at the Roman congress, could at least claim to be the only victorious Power which had relinquished its hold upon conquered territory. One practical result of the treaty was that Italy tacitly abandoned the cause of King Nicholas and accepted as inevitable Montenegro's incorporation in Yugoslavia.

The New Frontiers.—The consolidation of the new State was seriously delayed by the prolonged dispute with Italy and by the fact that for nearly two years after the Armistice the danger of an armed conflict could not be overlooked. But in five other directions also the frontiers were unregulated. (1). By the Armistice concluded at Belgrade on Nov. 12 1918 the Serbs were allowed to occupy Temesvár and most of the Banat, the east of which is overwhelmingly Rumanian and which was claimed in its entirety by Rumania, in right of her treaty of Aug. 1916 with the Allies. At the Paris Conference Rumania's enforced conclusion of peace with Germany was treated as absolving the Allies from obligations which were admitted in the parallel case of the Italian treaty: and the necessity of a partition on mainly ethnographic lines was from the first admitted. The special commission, after hearing the views of Trumbić and Bratianu, recommended a line which as nearly as possible balanced the Serb and Rumanian minorities left to Rumania and Yugoslavia respectively, and secured to the latter the essentially Serb districts of Torontál county: but at the instance of the French this line was modified to include Vršac (Versecz) and Bela Crkva (Weisskirchen) in Yugoslavia. This has the disadvantage that while the Serbs are stronger than any other single race in the two towns, their cession involved the loss of many purely Rumanian villages by Rumania, and also her loss of the important railway line connecting Temesvár southward with the Danube. (2). The regulation of the new Yugoslav frontier with Austria proved very thorny. Thanks to the efforts of Trumbić and the Slovene experts in Paris, Marburg (Maribor), a town with a German majority but surrounded by a purely Slovene district, was assigned to Yugoslavia: but under the Treaty of St. Germain a roughly triangular district north of the Karawanken range was referred to a popular plebiscite. The Inter-Allied Commission entrusted with the details was ordered to divide the disputed area into Zone A, mainly south of the river Drava (Drau) and Zone B, consisting of Klagenfurt and its basin, and to hold the plebiscite in the latter, only in

the event of Zone A voting for Yugoslavia. After a keen contest between the rival Slovene and Pan-German propagandists, voting took place in Oct. 1920, and resulted in a majority of 12,747 for Austria. The fact that many Slovenes voted against Yugoslavia was largely due to a desire to escape from all military service. Zone B, with Klagenfurt, now automatically passed to Austria. (3). Against Bulgaria the Yugoslav delegation claimed considerable frontier rectifications—(a) the Strumnica salient, which threatened the Vardar railway from the east, (b) the district of Kochana (Tocana) and the Bregalnitsa (Bregalnica), (c) a strip of territory running parallel with the old Serbo-Bulgarian frontier the whole way from Zajčar to Kyustendil, and (d) the town of Vidin on the Danube and the salient between it and the Timok. These claims were regarded by the Peace Conference as excessive, and under the Treaty of Neuilly only the two first were allowed, though in place of the third the town and district of Tsaribrod were assigned to Yugoslavia, and thereby the main strategic key to Sofia. This decision is so patently unjust that it has been very widely ascribed to a deliberate design to keep the two countries apart. (4). The Pan-Serb section of opinion in Belgrade, encouraged in this instance by some of the army chiefs for strategic reasons, has always coveted northern Albania: and the Montenegrin Unionists, led by Radović, made every effort to secure the adoption of their full claim by the Yugoslav delegation. This was opposed by Trumbić and all the more progressive elements in the new State, who realized that the claim to Skutari knocked the bottom out of the whole Yugoslav case against Italy and Austria. Thus the advocates of an unscrupulous "deal" on the lines of "Skutari for Fiume" failed to assert themselves, and Yugoslavia pronounced in favour of an independent Albania, merely reserving her right to share the spoils if it came to a general partition. After Giolitti's renunciation of a mandate in Albania the claim to Skutari became untenable, and at last in 1921 the Supreme Council sanctioned the frontiers assigned to Albania in 1913. Yugoslavia's relations with Albania, though simplified by this decision, have been affected by the Albanian counterclaim to Peč, Djakovo and the plain of Kosovo, where since the middle of last century the Albanian element had grown steadily stronger at the expense of the Serbs. The murder of Essad Pasha (June 1920) deprived the Serbs of their chief supporter in Albania: and friction was increased by the bad administration in the Sanjak and Macedonia, by the inability of the Durazzo Government to prevent continual armed raids against Serbian territory, and by the encouragement given from some Serbian quarters to the Mirdite rising in the summer of 1921. (5). The frontier with Hungary was the last to be regulated. The Treaty of Trianon satisfied the most essential claims of Yugoslavia, by dividing the whole Banat (save a small Magyar triangle opposite the city of Szeged) between her and Rumania, and by assigning to her the whole Bačka (except Baja and district), part of the Baranya (forming the angle between Drave and Danube) and the Medjumurje (between Drava and Mur). Thus, in order to secure the town of Subotica (Szabadka) with its large Bunjevac (or Catholic Serb) population, she was allowed to annex not less than 250,000 Magyars. Her claim to Pécs (Fünfkirchen) was disallowed, but owing to the long delay in ratifying the treaty, Yugoslav troops remained in occupation of this district and its valuable coal-mines till Aug. 1921, when at the instance of the Supreme Council it was handed over to Hungary. Meanwhile Pécs had become a centre of the exiled Magyar progressives, who preferred a provisional Yugoslav régime to the white terror of Adml. Horthy. On the eve of evacuation an attempt was made in Pécs to reestablish the Hungarian Republic under Count Károlyi, but owing to the communist views of some of its promoters the Belgrade Government withheld all support, and the movement promptly collapsed.

Internal Politics.—So long as vital frontier disputes were unregulated, the central Government in Belgrade held that elections could not be held, and governed for the first two years through a provisional Parliament, for which no one could claim a really representative character. The deputies for Serbia

delegation, declined American arbitration and threatened to withdraw altogether from Paris unless their territorial demands were conceded. This in turn strengthened the hands of the extreme section among the Yugoslavs, who now advanced the full ethnographic claim, involving Trieste and Gorizia as well as Dalmatia and Istria, and at the same time increased their demands against Bulgaria, Austria and Albania. Nor was it very easy for the Serbs and Croats to show moderation toward Italy, without appearing to desert the Slovenes, at whose expense, for obvious geographical reasons, the main amputations must inevitably take place. The bad impression made by the claims now submitted to the Supreme Council was only partially removed by a speech of Trumbić and by his proposal to leave the settlement of frontiers to a plebiscite (April 16). This offer was made in the knowledge that the memorandum addressed by President Wilson two days previously to Orlando and Sonnino had met with rejection, and was indeed well calculated to heighten the contrast between the outlook of the two rival nations toward Wilsonian principles. The American note reaffirmed these principles as the accepted basis of armistice and peace, and insisted on applying the same methods toward Austria-Hungary as Germany. It accepted the Brenner as a fair strategic line on the north, but argued that the Treaty of London was no longer applicable in respect of Italy's eastern frontier, since the line which it traced was designed to secure Italy against future Austro-Hungarian aggression, and Austria-Hungary had by now ceased to exist. It then defined what came to be known as "the Wilson Line," which assigned to Italy Gorizia, Trieste and Istria west of the river Arsa, but not Fiume, which must become an international port, nor any points south of it, save perhaps Lissa and Valona: it also advocated the dismantling of the whole eastern Adriatic coast. On April 23 President Wilson followed up this private memorandum by a public manifesto to the Italian nation, in which he repudiated the Pact of London and appealed for the application of the same principles on the Adriatic as those enforced against Germany. Fiume, he declared, must be the outlet, not of Italy, but "of Hungary, Bohemia, Rumania and Yugoslavia." Unhappily, despite its warm assurances of American friendship, this document met with a most hostile reception in Italy, where it was interpreted as an attempt to undermine the position of her spokesmen and so mete out to her a different measure from that prescribed by France and Britain. Thus the proposal entirely failed of its effect, and as Italy, Yugoslavia and America each adhered to its standpoint, and the two western Powers shrank from any constructive policy, a fresh deadlock ensued. At the end of May, however, M. Tardieu suggested a compromise by which the port and district of Fiume with most of eastern Istria and a total population of over 200,000 (mainly Yugoslavs) would form a small buffer state between Italy and Yugoslavia, under the guarantee of the League of Nations. President Wilson adhered to his own scheme, but made it clear that he would not oppose any direct agreement, whatever might be its terms: while the Yugoslavs, though accepting the idea of a buffer state, insisted upon their enjoying at Fiume a status analogous to that of Poland at Danzig, and added the impossible condition of a plebiscite after three years. During the final stages of the German treaty the Adriatic problem was once more shelved, until on June 29 and July 6 armed conflicts took place in the streets of Fiume between Italian and French soldiers, resulting in several deaths. A commission of inquiry was then at last appointed by the Allies, and ordered elections under inter-Allied control and the dissolution of the terrorist "League of Volunteers." But on Sept. 12, the very day on which American and British police were to be installed, D'Annunzio and his Arditi occupied the town, with the open connivance of the Italian naval and military authorities though to the embarrassment of the Roman Cabinet. The Allies, so far from attempting to restore order, withdrew their forces and allowed their authority to be flouted. The fresh deadlock that ensued was by no means distasteful to Rome, which drew encouragement from Wilson's increasing impotence at home, and therefore

played for time. At last on Dec. 9 1919 the Supreme Council (Clemenceau, Polk and Crowe) addressed a memorandum to Italy, outlining new terms of settlement—viz. the Wilson line (modified so as to leave Albona in Italy), a demilitarized buffer state, a special régime for Zara, cession of Pelagosa, Lissa and Lussin to Italy: Valona in full sovereignty, and an Italian mandate in Albania, under the League of Nations. The Italian claim of territorial continuity with Fiume was definitely rejected. Italy in her reply (Dec. 10) insisted on continuity (the real if unavowed motive of which was to control the port of Fiume in the interests of Trieste and Venice, and so retain some hold over Yugoslavia's commercial development), demanded the island of Cherso and the neutralization of the Yugoslav coast, and suggested a triple division—the *corpus separatum* of Fiume to Italy, the port to the League of Nations, and the rest of the buffer state to Yugoslavia. On Jan. 6 1920 Nitti, meeting with no response, wrote to Lloyd George to demand the execution of the Pact of London. At this stage the Yugoslav delegation committed a grave tactical blunder, Trumbić's views being overridden by the Balkan imperialistic aims of Pašić. While pleading for a plebiscite against Italy and doing lip service to an independent Albania within the frontiers of 1913, it added that in the event of any revision of those frontiers Yugoslavia would claim Skutari and all territory north of the river Drin (Drim). The sole justification for such a claim lay in the terms of the Treaty of London, which the Yugoslavs could not adopt as a basis without stultifying their whole position against Italy. But Italy, in her next memorandum to the Conference (Jan. 9) thus found it easier to reaffirm the validity of the treaty, while arguing that as it had envisaged the creation of three separate states (Serbia, Montenegro and Croatia) rather than of a big Yugoslavia, the clause regarding Fiume could no longer be upheld. On Jan. 13 Clemenceau and Lloyd George addressed new proposals to the Yugoslavs, in the form of a scarcely veiled ultimatum. The buffer state was now abandoned, the *corpus separatum* (with territorial continuity) falling to Italy, Sušak to Yugoslavia and the port of Fiume to the League of Nations: Italy was also to receive Lussin, Lissa and the Albanian mandate, while Zara was to be independent under the League. In originating this impromptu scheme, Lloyd George was influenced by secret indications that the Serbian reactionaries, if promised Skutari in return for Fiume, might throw over Trumbić and abandon the Wilson Line and American principles generally. As however Trumbić rallied the Yugoslav delegation to refuse the Franco-British project, Clemenceau the very next day introduced the important modification that Fiume should be an independent state under the League. When the Yugoslavs placed various conditions upon their acceptance, they were bluntly informed that unless they accepted within four days, France and Britain would authorize the literal execution of the Treaty of London, thus leaving Fiume to Yugoslavia, but all northern Dalmatia in Italian hands (Jan. 20). But this ultimatum was rendered invalid by a wire from Lansing, protesting against any settlement without the participation of America. Paris and London having assured Washington that neither concealment nor lack of courtesy was intended, Belgrade found it quite safe to reject the note of Jan. 20, which it pointedly described as "a friendly proposal, not as an injunction." It further expressed its inability to believe that the Powers wished to impose "a treaty concluded unknown to it by third parties, and whose clauses have never been communicated to it." (Jan. 28.) This incident led President Wilson to address to the Allied Cabinets a series of three notes (Feb. 10 and 25 and March 6) which will remain the classic documents of the controversy, and reduced his opponents to silence, though not to surrender.

After their passage the Adriatic question was again allowed to stagnate, the Powers resuming their negative attitude, while advocating direct discussion between the two parties. At last on April 25 Trumbić, having obtained the special sanction of the Belgrade Cabinet, informed Nitti of his readiness to negotiate, and a meeting between the two statesmen did actually take place at Ballanza on May 12: the commercial experts had

YUKON TERRITORY (see 28.945 and 15.847).—Although at one time the pop. of the Canadian province reached 30,000 to 35,000 the decline of the mining industry had reduced it to about 5,000 in 1921. Since the establishment of government in Yukon the administration of justice has been in the hands of the North-West Mounted Police, whose services in preserving law and order have been invaluable.

In the northern portion of the territory the ground below the surface remains frozen throughout the year, but from June to Oct. the climate is warm and sunny and vegetation grows freely in the valleys. Wild fruits such as bilberry, bearberry, crowberry, bog apple, currant, raspberry, foxberry and high-bush cranberry occur, besides numerous species of phanerogams. The Yukon is not an agricultural country, but oats, barley, rye, flax, potatoes, turnips and other garden vegetables are successfully raised. Parts of the territory are wooded with fair sized timber. White and black spruce are the most important trees, reaching 2,400 ft. above sea level: specimens having 21-in. stumps have been noted but the average diameter ranges from 12 to 16 inches. The timber cut is for home consumption. Poplar (two varieties) and canoe birch are found, also willows, alder, juniper and other shrubs, which form thickets and dense undergrowth.

Moose, caribou and sheep are plentiful in most localities, and black, brown and grizzly bears are numerous. Wolverines,

marten, lynx, ermine, rabbits and fox are the chief fur-bearing animals. The commonest birds are the Alaska jay, Swainson hawk, northern varied thrush, fox sparrow, grey checked thrush, and there are Hutchin geese, partridge, ptarmigan and ducks of many varieties. The waters of the Yukon are well stocked with fish, especially salmon, whitefish, trout, pickerel and pike.

The old primitive methods of extracting gold have been replaced by dredging and modern hydraulic methods. In 1920 the production of gold from the Yukon territory was 72,140 oz., against 90,705 oz. in 1919. This was obtained almost wholly from the alluvial sands and from the gold ores of the Conrad district. There has been a gradual falling off in production since 1913, when about 283,000 oz. worth \$6,000,000 were mined. It was estimated in 1920 that the total output of gold had been over \$150,000,000. Coal, copper, silver and other ores are mined and discoveries of silver ores at Kerro Hill have been reported.

The mountain system of the Yukon is the most remarkable in Canada, not only in regard to height and extent of glaciers, but also in scenic grandeur, majesty and imposing nature. It contains Mt. St. Elias, just within Canadian territory as delimited by the joint commission of boundary surveyors (17,078 ft.), and Mt. Logan within 20 m. of it (19,539 ft.). These, along with Mt. McKinley in Alaska, are the highest peaks on the North American continent. (W. L. G.)

ZAGLUL, SAAD (c. 1860–), Egyptian pasha, was the son of a notable in the district of Ibban, Gharbia Province. He was educated at the village school and afterwards at the university of El Azhar, in Cairo. When he had completed his prescribed course of studies, he was, in 1880, appointed editor of the *Official Journal*. Later he was nominated a Moawin under the Ministry of the Interior and eventually became Chief of the Contencieux for the province of Giza. Involved in the Arabi revolt, he was one of the many notables detained on the occupation of Egypt by British troops in 1882. On his release he ceased to hold office and in 1884, when the native tribunals were instituted, he began to practise at the bar. In 1892 he was appointed counsellor of the native court of appeal. Having become proficient in the French language and in the science of law, he obtained his diploma in law. He became Minister of Education in 1906, and under his "enlightened administration" it was said by Lord Cromer (*Modern Egypt*, vol. ii, p. 535) that "education in Egypt made rapid strides in advance." A change of the Ministry during Lord Kitchener's tenure of the Cairo Agency resulted in Zaglul's ceasing to hold the portfolio for Education, but he was appointed vice-president of the Legislative Assembly and he took a special interest in its deliberations until the outbreak of the World War, when the sittings of that body were temporarily suspended.

On the signing of the Armistice Zaglul, who had for long been considered the principal spokesman of the Nationalist party, appealed to the Residency in Cairo for the recognition of Egyptian independence, basing his demand on President Wilson's self-determination policy to which effect had been given by the British Government's issue of a Proclamation defining the status of the other countries liberated from Turkish rule by the war. When his proposal that he and some representative Nationalists should visit London to press their views was refused by the Government, he became discontented, and his attitude was so hostile that he and three others were arrested and deported to Malta. This was the signal for a murderous outbreak in Egypt in which British officers and others were killed, and the country became much disturbed. Zaglul and his friends were later released, and freedom of travel, which war measures had hitherto restricted, was permitted to all. A special Mission under the chairmanship of Visct. Milner was sent to Egypt in Nov. 1919 to enquire into matters and make representations. Zaglul eventually came to London and discussions between him, Adly Pasha and Lord Milner took place, the results of which were published in the "Milner Report." Zaglul returned to Egypt early in 1921, where he represented the extreme Nationalist party in opposition to the more moderate ministry under the presidency of Adly Pasha. At the end of the year, when trouble again broke out in Egypt, Zaglul was arrested once more and deported to Ceylon.

ZANGWILL, ISRAEL (1864–), English man of letters (see 28.956*), subsequently to 1909 published various volumes of essays, *Italian Phantasies* (1910), *The War for the World* (1916), *The Principles of Nationalities* (1918) and *The Voice of Jerusalem* (1920); and a novel, *Jinny the Carrier* (1919). In drama he produced *The War God* (1911, acted at His Majesty's theatre, London), *The Next Religion* (1912, London Pavilion), *Plaster Saints* (1914, Comedy theatre), and *Too Much Money* (1918, Ambassadors theatre). He took an active part as a speaker on behalf of the woman suffrage movement, and also as a pacifist during the World War. His attempts, as founder of the Jewish Territorial Organization, in connexion with the Zionist movement, to combine all the Jewish organizations in a scheme for the acquisition of the highlands of Angola as the "Jewish national home" had proved abortive before the outbreak of the World War; and subsequently, when the British Government gave its support to the setting apart of Palestine for this object, Mr. Zangwill and the J. T. O. declined to work with the Zionists

on this basis. The J.T.O., however, organized an Emigration Regulation department for deflecting the stream of Jewish emigration from the Ghetto of New York to the southern states of the American Union, west of the Mississippi, a fund being established for this purpose, to which Mr. Jacob Schiff contributed £100,000, the firm of Rothschild £10,000, Baron Edmund de Rothschild £10,000, and M. Brodsky, of Kiev, £10,000.

ZANZIBAR (see 28.958).—The pop. of the protectorate was estimated in 1920 at 198,000; that of Zanzibar I. at 115,000 and that of Pemba at 83,000. Zanzibar city had some 36,000 inhabitants. The Arab aristocracy—large landowners—numbered about 10,000; there was an equal number of British Indians and about 300 Europeans, the British colony being the largest.

The transshipment of goods to and from the mainland of E. Africa and the growing of cloves are the chief sources of wealth. In 1919 it was estimated that some 60,000 ac. were under cloves, with about 5,500,000 trees in bearing. The average output 1910–20 was about 14,000,000 lb. Next to cloves comes the cultivation of the coco-nut palm (or copra, there being in 1919 about 2,500,000 trees in the islands. In 1911 the clove crop was worth £436,000, in 1913 £412,000, and in 1918 £595,000. Copra exports in 1911 were valued at £203,000, in 1913 at £216,000, and in 1918 at £151,000 (having been worth £299,000 in 1917).

Apart from cloves and copra most of the exports figure also as imports, being goods in transit. Zanzibar, however, suffered to a considerable extent by the extension of direct steamship communication between Europe and India and the mainland of E. Africa, goods formerly transhipped at Zanzibar being taken direct to or from Mombasa, Tanga and Dar es Salaam. But if Zanzibar ceased to serve as a gigantic go-down or storehouse for the whole coast, it retained its position as the chief city of E. Africa and remained the headquarters of the principal Indian merchants trading with E. Africa. It also retained the dhow traffic, being visited yearly by hundreds of boats from the coast of Arabia and the Persian Gulf. The construction of a concrete wharf 1,300 ft. long, with a minimum of 30 ft. alongside, in progress in 1920–1, and other harbour improvements made Zanzibar port more accessible to shipping. The gross tonnage of shipping clearing the port in 1910 was 1,087,000; it rose to 1,502,000 in 1913, but fell, largely owing to war conditions, to 547,000 in 1916 and to 378,000 in 1918. It had risen to 582,000 tons in 1919. Imports (including bullion and specie) were valued at £993,000 in 1910, at £1,103,000 in 1913, at £2,366,000 in 1918 and at £1,934,000 in 1919. Exports in 1910 were valued at £1,033,000, in 1913 at £1,048,000, in 1918 at £2,133,000 and in 1919 at £2,444,000. The bulk of the trade is with India, England and E. Africa.

Revenue rose from £204,000 in 1910 to £407,000 in 1919; in the same period expenditure increased from £189,000 to £323,000. More than half the revenue is derived from customs. There was a public debt at the end of 1919 of £100,000.

History.—Sayyid Ali bin Hamud, the Sultan, a young man who had been educated at Harrow, who kept his court on European models and was fond of travel, abdicated in 1911 while on a visit to Europe. He died in Paris in Dec. 1918. Ali was succeeded by his brother-in-law Sayyid Khalifa ben Harud, a great nephew of Sultan Bargash. Khalifa, born at Muscat, Aug. 27 1879, had attended the coronation of George V. and was proclaimed Sultan on his return from London, Dec. 1911. He proved wholeheartedly loyal to the British, and his moderating influence did much to steady Moslem opinion in E. Central Africa during the war.

In July 1913 the control of the protectorate was transferred from the Foreign to the Colonial Office. Mr. Edward Clarke, the British Agent since 1909, had died at Zanzibar in the previous Feb. Under the Colonial Office the governor of British E. Africa (Kenya Colony) was appointed High Commissioner of Zanzibar, the local administration being in the hands of a British Resident, to which office Maj. F. B. Pearce was appointed in 1914. The Resident also took over the functions of first minister, a post which had been filled by Capt. F. R. Barton. The Sultan became president of the Protectorate Council, on which three Arab notables sat as unofficial members. The council has advisory powers only, but decrees of the Sultan are binding when countersigned by the British Resident.

During the war Zanzibar served as a base for the British naval squadron. On Sept. 20 1914, while the ancient cruiser

* These figures indicate the volume and page number of the previous article.

"Pegasus" was at anchor in the roadstead, undergoing repairs, it was sunk by the German cruiser "Königsberg," losing 25 killed and 80 wounded out of a crew of 240. The "Königsberg" also sank the guard ships "Cupid" and "Khalifa"—thus destroying the Zanzibar navy. About 5,000 Zanzibari served as carriers in the E. African campaign and the inhabitants contributed £70,000 to war funds.

In 1917 Sayyid Khalid, who for a brief period in 1896 had usurped the throne and had then taken refuge in German E. Africa, where he had since remained, surrendered to a British force. He was deported to St. Helena, whence in 1921 he was transferred to the Seychelles.

See F. B. Pearce, *Zanzibar, The Island Metropolis of Eastern Africa* (1920); J. E. Craster, *Pemba, The Spice Island of Zanzibar* (1913); the annual reports to the British Colonial Office.

(F. R. C.)

ZEEBRUGGE.—Among the British naval operations in the World War none created more interest than the attack on the Germans at Zeebrugge and Ostend, on the Belgian coast, in 1918. Ever since the German occupation of the Belgian coast, Zeebrugge had been a source of anxiety to the Dover Patrol. There the German torpedo craft and German submarines lay in a safe base only some 60 m. from the Straits, a danger to the Downs and a constant menace to British transports and trade in the Channel. Vice-Adml. Sir Reginald Bacon had contemplated an attack on it with monitors, but the Admiralty had disapproved, and it was not till the appointment of Rear-Adml. Sir Roger Keyes in Dec. 1917, that preparations were actually begun. The main object of the enterprise was to block the harbours of Zeebrugge and Ostend.

The actual harbour of Zeebrugge is small and is formed by a long curved mole on the western side, whose assault was an important part of the operation. This mole was $1\frac{1}{2}$ m. long, connected with the shore by a viaduct built on steel pillars. On the outside the western wall rose 27 ft. 10 in. above high water, with a ledge 2 ft. 9 in. wide running along it about 12 ft. above high water. The parapet on top was some 3 ft. wide with a drop of 4 ft. to a ledge 12 ft. wide which ran $16\frac{1}{2}$ ft. above the quay. The quay on the harbour side was 27 ft. wide, equipped in the usual way with cranes and three large sheds and shelters. At the outer end was a battery of 3 5·9-in. guns, and a narrower portion ran on to the lighthouse where 6 4-in. guns, were mounted.

The general plan of operations was simple. Three old cruisers, "Iphigenia," "Thetis" and "Intrepid" (all built about 1891), filled with cement, were to enter the harbour and be sunk at the entrance to the ship canal to Bruges. The "Vindictive," supported by two auxiliary vessels "Iris II." and "Daffodil," was to assault the mole on its outer and western side and by creating an impression that this was the main operation, divert the enemy's fire from the blocking ships. As Bruges was accessible by canal from Ostend, Ostend was to be blocked at the same time by the old cruisers "Brilliant" and "Sirius." The main obstacle to the enterprise lay in the powerful batteries. On the 40 m. of coast-line there were mounted 153 guns, including 6 15-in., 4 12-in., 33 11-in., 1 9·4-in., 23 8·2-in., 73 5·9-in., 6 5-in., 11 4·7-in., and 52 4-in. The coast positively bristled with guns. Only 3 m. E. of the Zeebrugge canal stood the Kaiser Wilhelm II. battery (known at Dover as the Knocke) armed with 4 12-in. with a range of 41,000 yd. One and a quarter m. W. of Ostend was the Tirpitz battery with 4 11-in. ranging 35,000 yd., and 3 m. E. of the town was the Deutschland (old Jacobynessen) equipped with 4 15-in. ranging 43,500 yards.

The approach to the entrance of the ship canal at Zeebrugge was under the fire of the Goeben battery of 4 8·2-in. guns at 1,000 yd., and the chance of success depended largely on an effective smoke screen.

The attack on the mole was to be made by the "Vindictive" (Capt. Alfred B. Carpenter), an old cruiser of 5,750 tons, 320 ft. long, 24 ft. draught specially fitted for the occasion, assisted by the "Iris II." (Comm. Valentine Gibbs) and "Daffodil" (Lt. Harold G. Campbell), two Liverpool ferry boats of large capacity and light draught. The viaduct of the mole was to be

blown up by two submarines, C1 (Lt. Aubrey Newbold) and C3 (Lt. Richard D. Sandford). A strong body of 15 destroyers was attached to the Zeebrugge force under Capt. Wilfred Tomkinson ("Phoebe," "North Star," "Trident," "Mansfield," "Whirlwind," "Myngs," "Velox," "Morris Moorsom Melpomene," "Tempest" and "Tetrarch" to escort the force and cover it to seaward; "Termagant," "Truculent" and "Manly" to screen the Zeebrugge monitors). A force of 18 coastal motor boats (55 ft. long, 3 ft. draught, 35 knots, 2 18-in. torpedoes) under Lt. Arthur E. Welman accompanied the expedition, of which 8 were allocated for the smoke screen, 5 to support the "Vindictive," and 4 to attack vessels inside the harbour. With them were 33 motor launches under Capt. Ralph Collins for smoke screens, and inshore rescue work. Out to seaward were the two monitors "Erebus" and "Terror" for bombarding the batteries. The Rear Admiral's flag flew in the destroyer "Warwick."

The three old cruisers "Thetis" (Comm. R. S. Sneyd), "Intrepid" (Lt. Stuart Bonham-Carter) and "Iphigenia" (Lt. E. W. Billyard-Leake) were to act as blocking ships. The two latter were of 3,600 tons displacement, 300 ft. long x 43½ ft. x 18½ ft., and the "Thetis" was a little smaller (3,400 tons and 17½ ft. draught).

A similar attempt was to be made at Ostend. There the blocking ships were to be the old cruisers "Brilliant" (Comm. A. E. Godsal) and "Sirius" (Lt.-Comm. H. N. Hardy) of 3,600 tons. They were to be supported by five bombarding monitors ("Marshal Soult," "Lord Clive," "Prince Eugene," "General Crawford," M24 and M26) and covered by five British destroyers ("Swift," "Faulknor," "Matchless," "Mastiff" and "Afridi"), with three British destroyers and six French torpedo boats attending on the monitors ("Mentor," "Lightfoot," "Zubian," "Lestin," "Capitaine Mehl," "Francis Garnier," "Roux," "Bouclier"). Eighteen British motor launches under Comm. Hamilton Benn and four French were attached for smoke screen, inshore and rescue work, and the whole force was under Commodore Hubert Lynes.

The object of the attack on the mole at Zeebrugge was first to seize the battery at the seaward end and prevent it firing at the block ships, and then to demolish the structures on it as far as possible. The battery was 250 yd. from the lighthouse, and to facilitate its seizure the "Vindictive" was to berth nearly abreast of it on the outer side of the wall. It was then to be stormed by three companies of bluejackets—A company under Lt.-Comm. Bayan Adams ("Princess Royal"), B under Lt. Arth. G. Chamberlain ("Neptune"), D under Lt.-Comm. G. N. Bradford; all under Lt.-Comm. Arthur Harrison ("Lion").

Some 150 yd. to shoreward of the battery and 400 yd. from the lighthouse there was a "fortified zone" of barbed wire and machine-guns. As this commanded the "Vindictive's" berth and would form a rallying point for reinforcements from landward, it was to be seized by four companies of Royal Marines—A (Chatham) under Maj. Chas. Eagles, B (Portsmouth) Capt. Ed. Bamford, C (Plymouth) Maj. Bernard Weller, and machine-guns under Capt. Chas. B. Conybeare.

The storming parties numbered 50 officers and 980 men of the Royal Navy, drawn chiefly from the Grand Fleet and the Nore, and 32 officers and 718 men of the Royal Marines. The seamen were under Capt. Henry C. Halahan and the marines under Lt.-Col. Bertram Elliot. Preparations began early in the year. The force was segregated in the Swin (Thames) and specially trained in all its various tasks. The blocking ships were stripped of all fittings and filled with rubble and concrete. The "Vindictive" in addition to her 10 6-in. guns was given a special equipment of 2 7·5-in. howitzers (1 fwd. and 1 aft), 1 11-in. howitzer (aft), 16 Stokes mortars, flame throwers, 16 Lewis guns, and 4 1½-in. pompoms. The success of the attack depended largely on an effective smoke screen, and Wing-Comm. F. A. Brock and 60 ratings were lent to the Dover command, where a small factory was set up to prepare the materials for it.

The lessons of history were not very favourable to the enterprise. Naval Constructor R. P. Hobson had tried to block

Twice the force was assembled and twice unfavourable conditions supervened. On the night of April 11-12, it was within 13 m. of its rallying point. Finally the night of April 22-23 was fixed for the attack. The main force started at 4:53 P.M. on Monday, April 22. The bombardment was to begin at 11:20 P.M., simultaneously at Zeebrugge and Ostend. The smoke screen was to start at 11:40 P.M. The "Vindictive" was to reach the mole at midnight. The "Thetis" was to pass the end of the mole 25 minutes later. The last point of departure was at a point called G in lat. $51^{\circ} 27' N.$, long. $2^{\circ} 50' E.$ This and other points on the route were marked by buoys laid after careful triangulation by Capt. H. P. Douglas and Lt.-Comm. Francis E. Haselfoot. It was here, some 12 m. off Zeebrugge and Ostend, that the vessels took up their formation for attack. The "Vindictive," which had been towing the "Iris II." and "Daffodil," cast them off. The "Sirius" and "Brilliant" shaped course for Ostend, the "Thetis" and her companions eased down. The host of small craft dispersed for their various tasks. The night was overcast, with a light wind from the N.E., and a thick column of smoke soon began to roll down the coast, hiding everything.

The seamen of A and B companies under Lt.-Comm. B. F. Adams, got ashore, and dropping on to the ledge below the parapet made their way toward the lighthouse. They came to

a lookout station which they captured. Here an iron ladder led down on the quay and three of the party went down it. A machine-gun in the fortified zone was firing on them, and Lt.-Comm. Adams advanced towards it for some 40 yd. and after taking up a position returned to collect more men. Lieutenant-Commander Harrison, severely wounded in the head, arrived about this time and took charge. Lieutenant-Commander Adams met Maj. Weller who gave him reinforcements, but by the time he got back Lt.-Comm. Harrison had led a rush along the parapet, where he and several of his men were killed by machine-gun fire. Able seaman Mackenzie's courage here gained him a V.C., and able seaman Evans was seriously wounded and taken prisoner in trying to bring in Lt.-Comm. Harrison's body. D Company was still in the "Iris II," but the marines were forming up on the mole to make an assault.

They had been busy at first in the other direction. The first platoon to get ashore made to the right toward the shore and silenced a party of snipers near No. 2 shed. Captain Bamford (awarded the V.C.) joined them and they reached and held a point 200 yd. toward the shore. Another party of marines dropping straight to the mole had established a strong point by No. 3 shed close to the "Vindictive." About 12:20 a terrific roar and a great sheet of flame rose high above the din. The viaduct had gone up, and the mole was secure from landward side. Major Weller now received Lt.-Comm. Adams' request for reinforcements and sent a platoon and the remains of another to help him.

They advanced toward the lighthouse and reached the lookout station, where they were held up again by machine-gun fire. Lieutenant-Commander Adams and his men were some 40 or 50 yd. ahead. Nos. 5, 7 and 8 platoons were forming up under Capt. Bamford for an assault on the fortified zone. This was the position when the signal to retire blared out.

The demolition company (C Company of seamen) had got ashore under Lt.-Comm. Dickinson, but the storming parties were too close to permit of the sheds being blown up, and an attempt to blow up the destroyers was beaten back. The danger of the attack from landward had been removed by the destruction of the viaduct. Submarine C1 had parted its tow and did not reach the scene in time. Lieutenant R. D. Sandford (awarded the V.C.) in C3 had sighted the viaduct about half a mile off, and running into the iron piers at 9½ knots had jammed the vessel with its 5½ tons of amatol hard and fast. The fuze was lighted and the crew of six were pushing off in their little motor skiff when the propeller was torn off by fouling the submarine, and they had to take to the oars. A rain of bullets fell close to them, and struck down two oarsmen in succession. They were 300 yd. away when the viaduct went up, scattering huge pieces of iron and concrete around them.

Another bullet struck Lt. Sandford, but just at that moment the picket boat with his brother (Lieut.-Comm. Francis Sandford) came up and took them off. Meanwhile, in the "Vindictive," Capt. Carpenter had seen the block ships go in. The position of the storming party and of the ship was precarious. None of the mole anchors had grappled. The ship was being held into the mole by the "Daffodil," and if she were disabled it was practically certain that the men in the mole would not get back. He decided it was time to retire. His own siren was riddled through and through, but the order was passed to the "Daffodil," and the shriek of its siren rose above the din.

It was 12:50 A.M. The parties came gradually back, the marines retiring in perfect order, bringing their wounded with them. Capt. T. M. Palmer refused to leave the shore while any of his men were there, and joined the ranks of the missing. Wing-Comm. F. A. Brock, too, never returned. He was last seen fighting on the mole.

A hawser was passed from the "Vindictive," and at 1:10 A.M. the "Daffodil" began to pull her bows off the mole. The hawser just held long enough to swing her bows round, and she got clear. The "Iris II." came under a heavy fire as she left the mole. A large shell carried away the port side of the bridge, mortally wounding Comm. V. Gibbs and Maj. Chas. Eagles.

Lieutenant Spencer, though seriously wounded, continued to con the ship and got her clear. Three more shells hit the ship and caused heavy casualties in the crowded decks, but Motor Launch 558 (Lt.-Comm. Lionel Chappell, with Capt. Ralph Collins on board) came up, and throwing a smoke screen round her helped her to get away.

To return to the blocking ships. With the "Thetis" leading they had rounded the lighthouse in a storm of shot and shell. The "Thetis" propeller fouled a net laid at the entrance to the harbour and carried it with her. Both engines brought up, and she grounded 300 yd. from the pierhead. She was under heavy fire, and as she appeared to be sinking, the order was given to abandon ship and blow the charges; they detonated and the ship sank. The crew manned the remaining cutter and pulled to ML526 (Lt. Hugh Littleton) which was lying near.

The "Intrepid" astern had come under heavy shrapnel fire from the guns as she approached the mole, but after rounding it escaped their attention. She had 87 officers and men in her instead of 54, as the surplus had contrived to stay on board rather than miss the fight. She ran right into the canal, and Lt. Bonham Carter went full speed ahead with the starboard engine and full speed astern with the port to turn her round. As the ship commenced to make stern way he blew the charges, and the crews got into two cutters which were picked up by the "Whirlwind" and a motor launch. Lt. Bonham Carter with two officers and four petty officers had got on a Carley raft and floated down the canal. ML582 (Lt. Percy T. Dean, awarded the V.C.) had come right into the canal behind the "Iphigenia," and under a heavy fire picked them up and took them off. All the crew except one were saved. In the "Iphigenia," like the "Intrepid," the engine room ratings had avoided being taken off, so as to be present at the fight. She came under shrapnel fire off the mole, and as she rounded it a star shell showed up the "Intrepid" heading for the canal and the "Thetis" aground. Two shells struck the ship on the starboard side. The canal was hidden by smoke. It lifted for a moment, and the captain, seeing he was heading for the western pier, went full speed astern, then ahead with the starboard engine, and with a barge in front of him drove into the canal. There was a gap between the "Intrepid" and the eastern bank; he steered into it, collided with the "Intrepid," rang the gong to signify the imminent blowing of the charges, went astern and then ahead. She grounded on the eastern bank and the charges were fired. The crew left the ship in the only cutter left under fire. ML282 (Lt. Percy T. Dean) was waiting and took the crew on board, and then making the cutter fast to his stem went out of harbour stern first at full speed. Heavy machine-gun fire was concentrated on her; two officers were dangerously wounded and two of the launch's crew of four killed, but she got clear.

The destroyers had been lying off the harbour, and the "Warwick" now picked up four motor launches, including ML282 overloaded and full of wounded with 101 men of the "Iphigenia" and "Intrepid." ML110 (Lt.-Comm. Dawbarn Young) had come under a heavy fire while trying to show the blockships the way in. She was struck by three shells, which killed or wounded half the crew and wrecked the engines. Her captain, hit in three places and mortally wounded, gave orders to the last, but died before reaching Dover. The "Warwick," "Phoebe" and "North Star" had been cruising off the mole to screen the force from torpedo attack. The destroyer "North Star" losing her bearings in the smoke had emerged from the smoke screen and coming under a heavy fire was reduced to a sinking condition. The "Phoebe" (Lt.-Comm. Hubert Gore-Langton) attempted to tow her out, but the hawser was shot away once, and parted another time. She was therefore abandoned and sunk. By 1:30 it was all over and the force was on its way back to Dover. The "Vindictive" in terrible disarray arrived there soon after 8 A.M. on April 23. The "Iris II.," limping behind her, reached home at 2:45 P.M. Her commander had died that morning.

Meanwhile things had gone badly at Ostend. The blocking ships "Brilliant" (Comm. Alfred Godsal) and "Sirius" (Lt.-

Comm. Henry Hardy), escorted by the Harwich destroyers "Tempest" and "Tetrarch," arrived off the coast. The motor launches under Comm. Hamilton Benn were busy laying a smoke screen, supported by the "Faulknor" (flying Commodore Hubert Lyne's broad pendant), "Lightfoot," "Mastiff," "Afridi," "Swift" and "Matchless." The wind was blowing lightly from the N.W., but about 11:50 shifted to the S.W. and blew back the smoke screen. The low clouds and drizzle made visibility difficult, and the Stroom Bank buoy could not be seen at first. Thinking that the ships were perhaps too far to the northward, Comm. Godsall continued on his course for two minutes, when he sighted the Stroom Bank buoy to the N.E. and turned to pass to northward of it. It was not, however, in its normal position (approximately 1 m. W.N.W. of the entrance), but had been shifted about a mile to the eastward. Commander Godsall steered from the buoy for the supposed direction of the harbour. As he looked anxiously out for the pierheads at Ostend, breakers suddenly loomed up on the starboard bow, and before the ship could turn she was ashore. The "Sirius" behind her grounded too. Fire had been opened from shore, and both ships were accordingly blown up where they stranded about a mile east of the piers. ML276 (Lt. Roland Bourke) took off the "Brilliant's" crew, while ML283 (Lt. Keith Hoare) rescued the men from the "Sirius." A second attempt to close Ostend was made on the night of May 9-10 by Comm. Alfred Godsall in the "Vindictive" and Lt.-Comm. Hardy in the "Sappho," an old cruiser of the same class as the "Sirius." This time there was no preliminary bombardment but aircraft were coöperating. Conditions seemed favourable for the attempt. The sea was smooth, the night dark with wind from N.W., but hardly had the ships left Dunkirk when the "Sappho" blew out a manhole joint in her boiler and had to put back.

At 1:30 A.M. the small craft went in to lay the smoke screen. News had previously come in that the Stroom Bank buoy had been removed, and Lt. W. R. Slayter went in a coastal motor boat to place a calcium flare in its old position. By 1:35 the smoke cloud was beginning to come down, and at 1:43 the order was given for the monitors to open fire. A roar of batteries answered from the shore. Two coastal motor boats, CMB24 and 30, dashed ahead and torpedoed the piers. But once again misfortune was to attend the attempt. As the "Vindictive" approached, a thick sea fog rolled up the coast, making it impossible to see anything at over 300 yd. Uncertain as to his position, Comm. Godsall steered to westward and then to eastward, and finally gave orders to CMB23 (Lt. Hon. Cecil Spencer) to light a million-candle flare. Though dimmed by the fog and drizzle, its glare revealed the entrance 200 yd. off. The "Vindictive" steered for it and the guns found her at once. The after control was demolished by a shell which killed everyone in it. The bridge was swept with bullets, and Comm. Godsall ordered everyone inside the conning tower. She was close to the eastern pier when a heavy shell burst close to the conning tower, which must have killed the commander for he was never seen again. Lt. Victor Crutchley took command and tried to turn her up the channel, but she grounded at an angle of about 25° to the pier and lay hard and fast. Engineer Lieutenant Wm. C. Bury blew the charges and she sank. The captain could not be found. ML254 (Lt. Geoff. Drummond, awarded the V.C.) came alongside under a fierce fire. His lieutenant and deck-hand were killed and he himself wounded in three places, but he managed to embark 39 officers and men, and then backing out of the entrance got clear and just managed to reach the "Warwick." Day was breaking and as the boat was badly damaged she was sunk. ML276 (Lt. Roland Bourke, awarded the V.C.) now returned to the "Vindictive," and after searching and shouting found Lt. Sir John Alleyne and two men, all badly wounded, clinging to a skiff. With three of his own crew killed or wounded Lt. Bourke managed to get out and reach the monitor "Prince Eugene" in safety.

This was the end of an enterprise for which no fewer than nine V.C.s were awarded. Its casualties amounted to a total of 10 killed, 20 wounded and 27 missing.

April 22-23	Killed or died of wounds	Wounded	Missing
Officers	19	29	2
Seamen	56	136	
Marines	93	205	14
"North Star" . .	21	13	
	189	383	16
May 9-10			
Officers	2	5	2
Men	6	25	9
	197	413	27 = 637

In judging what was achieved it is necessary to remember that at the end of 1917 and early in 1918 the whole efforts of the navy were directed toward one goal—to counter the submarine. The greatest losses were in the Channel where the Flanders flotilla worked, and the blow they would have received by the blocking of Zeebrugge and Ostend was well worth the risk. It was, however, only partially successful. Ostend, though the width of the entrance was reduced probably to 300 ft., was not closed, and though the ships sunk in Zeebrugge must have caused great inconvenience and delay it may be doubted whether they actually stopped the passage of submarines for more than a month. The entrance was 300 ft. wide; there was still a space of some 60 ft. between the stern of the "Iphigenia" and the pier, and by dredging along the edge and fixing up warping bollards it was made possible to warp submarines in and out at high water. The enterprise had another aspect. The navy chafed at its inactivity and looked eagerly for some outlet where it could get at grips with its enemy. The blocking of Zeebrugge and Ostend offered a good prospect of success and was within a reasonable distance of it. And if it did not wholly succeed, the work of those who took part in it sent a breath of inspiration through the navy and gave all who took part in it a lasting name. (A. C. D.)

ZEPPELIN, COUNT FERDINAND VON (1838-1917), German airship inventor, was born at Constance, Baden, July 8 1838. He was educated for the army and received a commission at the age of 20. He served, as a volunteer, in the Federal army during the American Civil War and whilst in America made his first balloon ascent. Returning to Germany, he saw active service in the Austrian war of 1866 and in the Franco-German War of 1870. In 1891 he retired from the army with the rank of general and thenceforth devoted his energies to the study of aeronautics. In 1900 he built an airship, which rose from the ground and remained in the air for 20 minutes, but was wrecked in landing. In 1906 he made two successful flights at a speed of 30 m. an hour, and in 1907 attained a speed of 36 miles. From that time onwards his airship construction made steady progress, and the success he had achieved was evidenced by the exploits of the Zeppelin airships in the World War. He died at Charlottenburg March 8 1917.

ZHILINSKY, YAKOV (1853-1918), Russian general, was born in 1853. On finishing his course at the Cavalry school in St. Petersburg in 1876 he was given a commission in the Guards cavalry, and in 1883 he was appointed on the general staff. He became in 1890 commander of a dragoon regiment, and in 1900 was promoted to the rank of general. During the Spanish-American War he was one of the foreign military attachés at the American general headquarters. In the Japanese War (1904-5) he was appointed chief of staff of the Viceroy of the Far East, Adml. Alexeyev, and in 1909, when Sukhomlinov became War Minister, Zhilinsky became head of the general staff. At the beginning of 1914 he was appointed to command the troops of the Warsaw military district, and on the declaration of war in 1914 he became commander-in-chief of the north-western front. After the defeat of Aug. and Sept. in eastern Prussia inflicted on his armies (Samsonov's and Rennenkampf's) he was recalled. In 1915 and 1916 he was the military representative of the Russian supreme commander-in-chief at the French headquarters. Zhilinsky was reported killed by the Bolsheviks in 1918.

ZICHY, COUNT EUGEN (1837-1906), Hungarian traveller (see 28.979), died in 1906.

ZIEM, FÉLIX FRANÇOIS GEORGE PHILIBERT (1821-1911), French painter (see 28.979), died in Paris Nov. 11 1911.

ZIMMERMANN, ARTHUR (1859-), the German Foreign Secretary who, during the World War, conceived the idea of trying to inveigle Mexico into an alliance against the United States, was born May 8 1859 at Frankenstein. After having been vice-consul at Shanghai and acting consul in 1900 at Tientsin, he entered the Foreign Office in 1902 in a subordinate capacity and rose by 1910 to be director of the Political Section. In 1911 he was appointed under-secretary and in Nov. 1916 Secretary of State in succession to von Jagow. In this capacity he addressed to America the note of Jan. 31 1917 on the subject of U-boat warfare. He was also the author of the extraordinary invitation of Jan. 19 1917 to Mexico to enter into an alliance with Germany and to sound Japan as to her willingness to coöperate. For Mexico the price of this alliance was to be the American States of New Mexico, Texas and Arizona. This proposal, which was sent through the medium of the German minister to Mexico, von Eckhardt, was intercepted in America, and President Wilson was in a position to publish it on March 1, 1917. With other disclosures regarding German machinations against the United States it materially contributed to rouse American national feeling, which found expression in the decisive votes of the Senate and the House of Representatives on April 5 in favour of declaring war upon Germany. Zimmermann retired on Aug. 5 1917 shortly after the resignation of Bethmann Hollweg. The German Liberals and the governmental Socialists had withdrawn their support from Bethmann Hollweg's Government at the time of the so-called "Peace Resolution" (July 19 1917), largely on the ground that it was inconceivable that the Allies and America should ever negotiate with politicians like Zimmermann and Bethmann, who had been guilty of the note to Mexico and other treacherous proceedings.

ZINOVIEV, GRIGORI [OVSEI GERSHON ARONOR] (1883-), Russian revolutionary politician, was born at Novomirgorod in 1883. He was of Jewish origin and his original name was Aronor, but he was known in early life under the names of Apfelbaum or Radomyslovsky and later adopted several designations, such as Shatski, Grigoriev, Grigori and Zinoviev, by the two last of which he is most frequently called. For many years he was an active member of the Russian Social Democratic Labour party, and attended the London Conference in 1907. The next year he was arrested on a charge of participating in the work of the printing press *Rabotnik*, sentenced to a term of solitary confinement in St. Petersburg and forbidden to reside there in future. He then made his way abroad, and in 1909 was editing the *Social Democrat*, the party's main organ. He was present at the party meeting of Nov. 1915, when a split occurred amongst the Russian Social Democratic members of the Duma, and earlier in that year had attended the Zimmerwald meeting at Berne, consisting mainly of Lenin's group, where arrangements were made to get copies of the *Social Democrat* secretly into Russia and to keep in close touch with Karl Liebknecht and Rosa Luxemburg in Germany so as to ensure the distribution of Lenin's literature to Russian prisoners of war.

After the Revolution Zinoviev returned to Russia and became a prominent member of the Petrograd Soviet, of which he became president after the murder of Uritsky in 1918. In the summer of 1917 the paper *Den* published revelations showing that he had been formerly employed by the department of police, and this statement was not refuted.

Zinoviev became a member of the Petrograd Committee and of the Central Committee of the Russian Communist party, and was first president of the Third (Communist) International. He was also president of the Petrograd Extraordinary Commission for combating counter-revolution, speculation and sabotage, and he occupied the position of president of the Soviet Government in Petrograd.

ZIONISM (see 28.986).—The part played by anti-Semitism in the growth of the Zionist movement has often been exaggerated.

Zionism is a natural, indeed an inevitable, outcome of the instinct of self-preservation, which is as strong in the Jewish people as in any other; and the conditions which threaten the continued existence of the Jewish people in modern times are not wholly referable to anti-Semitism in any of its phases. They are equally present in countries in which anti-Semitism does not exist, or, if it exists, does not seriously affect the civic, social or economic position of the Jews. In such countries—which include, broadly speaking, all the countries of the western hemisphere except those of the old Russian and Austrian Empires and Rumania—the rapid assimilation of the Jews to the prevailing modes of life and thought is accompanied by an attenuation of the tie which binds them to their people, with the result that emancipation is a more potent enemy of Jewish solidarity and of Judaism than persecution or the milder forms of anti-Semitism. It follows that from the point of view of the Jews, which of course postulates the desirability of the continued existence of the Jewish people and of Judaism, the substitution of conditions of emancipation for conditions of persecution solves one problem only by creating another. Naturally enough, this was not foreseen by Moses Mendelssohn and the other pioneers of Jewish emancipation in Europe. They took it for granted that the Jew, having emerged from the ghetto and divested himself of the external peculiarities which cut him off from European life, would still be able to maintain his religious separateness, and to carry out a specifically religious and moral mission in the modern world. But experience has shown them to have been wrong. Judaism reduced to a set of religious beliefs and practices, or to a moral code with some superstructure of ritual, has no abiding hold on the Jew. The possibility of the continued existence of the Jewish people and of Judaism stands or falls with recognition of the fact that to be a Jew means primarily to be a member of a particular ethnic group. On that basis it is possible to build attachment to Judaism as religion or as moral teaching; without that basis the Jew is powerless to withstand through successive generations the forces of an environment which is always drawing him away from his own tradition, in its religious, ethical and intellectual aspects even more than in its ceremonial aspect. Hence a reaffirmation of the national idea in Judaism is even more readily intelligible as a reaction against the results of emancipation than against persecution.

It is not surprising, therefore, that, when the case for Jewish nationalism was first presented by a Jew in a European language, it was based on the disintegrating effects of assimilation rather than on the sufferings of the unemancipated Jews. In his *Rom und Jerusalem*, published in 1862, Moses Hess delivered a trenchant attack on the theory of German "Reform" Judaism, showed that Judaism could not live except on the basis of the national idea, and foretold a spiritual and political rebirth of the Jewish people in Palestine. Fourteen years later Jewish Nationalism was advocated on similar lines by George Eliot in *Daniel Deronda*. For both writers the essential thing is that the Jewish people should have an opportunity of taking up the broken thread of its history, and of expressing its own spirit and characteristics in a form of life shaped by itself. Considerations based on anti-Semitism are secondary.

Even in Russia, for so long the home of the great masses of Jews and the very temple of governmental anti-Semitism, Zionism was not fundamentally a product of persecution or pogroms. Until well after the middle of the 19th century, the best minds of Russian Jewry saw its hope in emancipation, not in nationalism. They thought that if the Jews of Russia discarded their distinctive language and dress, modified their religious ceremonial so as to make it compatible with European life, and sent their children to Russian schools, they would be admitted to full participation in the life of their country, like the Jews of western Europe, and all would be well. A vigorous propaganda on behalf of *Haskalah*—"enlightenment" or "modernism"—had been carried on for some decades in the Hebrew language, which was used not because of its national associations, but because the apostles of *Haskalah* disdained to write in Yiddish, and no European language was intelligible to

those whom they wished to influence. *Haskalah* had made considerable headway against the obscurantism of those who opposed any and every change in Jewish life; and in the 'seventies of the 19th century the liberal policy of Alexander II. seemed to promise success to its efforts to modernize Russian Jewry. But already, within the modernist movement itself, another current of thought had set in. Perez Smolenskin, one of its most gifted champions, who spent the best years of his life in Vienna, had had the opportunity of seeing at close quarters what emancipation meant for Judaism. He had seen that in practice the ideal of being "a Jew at home and a man outside" did not work. Hence he became the advocate of a Jewish nationalism based on the "triple cord" of the Land (Palestine), the Law (*Torah*) and the Language (Hebrew). When, in 1880, the emancipatory tendencies of Alexander II. gave place to a wave of pogroms and a policy of systematic oppression, the seed sown by Smolenskin bore fruit. While the great majority of the Russian Jews who fled from massacre naturally made for the economically developed countries of the West, where they could be readily absorbed, a few, inspired by the ideal of a national revival, found their way to Palestine, and in the face of incredible difficulties laid the foundations of Jewish agricultural colonization. Supported by the *Chovevê Zion* (Lovers of Zion) in Russia, and later more amply by Baron Edmond de Rothschild, of Paris, these pioneers succeeded in maintaining their footing in Palestine. They were followed by a small but steady stream of immigration, which included many vigorous and self-supporting elements. Innocent of any concern with international politics, these Palestinian settlers accepted the Turkish administration as they found it, and, thanks largely to its very indifference, were able to establish little settlements with complete internal autonomy, to live in their own way, to manage their own affairs, and, not least important, to create a system of Hebrew schools, by means of which the ancient language of the Jews was revived as the speech of the younger generation of Jews in Palestine. This new Palestinian *Yishub* (settlement), strengthened in the early years of the present century by a number of young men and women who went to Palestine with the ideal of working as labourers on its soil, became the basis of the political success which Zionism achieved during the World War. The historic connexion of the Jews with Palestine would not of itself have availed to secure recognition of Jewish national aspirations, had there not been this concrete evidence of the will and the ability of the Jews to rebuild Palestine and their own national life in Palestine.

Side by side with this practical colonization work, the development of Jewish nationalist theory went on in Hebrew literature. The implications of Smolenskin's idea were worked out more thoroughly, and from a standpoint more in consonance with European thought, by Asher Ginzberg (*Achad ha-Am*), one of the early leaders of the *Chovevê Zion*, who has made his own the conception of Palestine as destined to be in the immediate future the "spiritual centre" of the Jewish people—that is to say, the home of a corporate Jewish life expressing in all its aspects the true qualities of the Jew, and serving for that reason as a point of attachment and a source of spiritual influence for the Jews of all the world, who will find in their common association with the spiritual centre a new basis of unity and a new bulwark against absorption by assimilation. This conception, though by no means universally accepted as a complete statement of the philosophy of Zionism, has had a profound effect on Zionist thought for the last 30 years, and, though it designedly leaves on one side the political implications of Zionism, has contributed materially to the final shaping of the political claims of the movement.

The reaction against anti-Semitism has, however, played an important part in Zionist history. In 1882, after the terrible outbreak of pogroms in Russia, a Russian Jew, Dr. Leo Pinsker, published a striking pamphlet, in German, under the title of *Auto-Emancipation*, in which he argued that Judeophobia was the endemic malady among the peoples of the world, analogous to the fear of ghosts, and that the only solution of the "Jewish Problem" was to be found in the establishment in some suitable

territory (not necessarily Palestine) of an autonomous commonwealth of Jews. While Pinsker thus took anti-Semitism as his starting point, he yet showed a certain appreciation of the historical and psychological roots of Jewish nationalism; and when his own scheme of large scale emigration to a hypothetical Jewish territory met with no support, he was nationalist enough to throw himself into the Palestinian work of the *Chovevê Zion*, whose first President he became. The later and more famous brochure of Dr. Theodor Herzl, *Der Judenstaat* (1896), elaborated independently a scheme similar to that of Pinsker, based entirely on the need of a refuge from anti-Semitism, and disregarding completely the inner springs of Jewish nationalism. Herzl's argument implies throughout that all would be well if only Jews were allowed to assimilate peacefully to their surroundings; and to that extent he stood on the same ground as the assimilationist Jews of western Europe, who had for years been trying—without success—to alleviate the lot of the Jews of Russia and Rumania by bringing about diplomatic intervention with the Governments of those countries. He differed from them only in seeing the futility of their methods and the need for more radical steps. He did, however, assert the unity of the Jewish people ("we are a people, *one* people"), and the emancipated Jews of western countries, fearful of anything that might seem to cast doubt on their absolute identification with the nations among which they lived, could not accept a scheme based on such promises. With few exceptions, the Jews of the west met Herzl's appeal with indifference or hostility; it was the *Chovevê Zion* who rallied to his support with enthusiasm, less conscious of the difference between his philosophy and their own than of the value to their movement of his great personality, vision and influence. Thus there came about a fusion between the older Jewish nationalism, rooted in history and attached by its very nature to Palestine, and the newer so-called nationalism which demanded an autonomous territory in Palestine or elsewhere for those Jews who could not or would not assimilate to their European surroundings. The fusion was not effected without tears. At the first Zionist Congress (Basle, 1897) there was a struggle over the crucial question of the mention of Palestine in the programme of the movement. For Herzl's scheme of rapid mass-settlement scarcely any country could have been worse adapted than Palestine, with its restricted area, its neglected soil and its importance in international politics; but the nationalist instinct of the Russian Jews won the day, and the Zionist organization tied itself down to the aim of "establishing for the Jewish people a home in Palestine secured by public law."¹ The trouble did not end there. For the *Chovevê Zion* the gradual building up of a Hebrew life in Palestine—*Yishub Eretz-Israel*—was the fundamental nationalist activity. Herzl, on the other hand, deprecated any "infiltration" into Palestine so long as the conditions necessary for full autonomy were not secured. He desired the acquisition by the Jewish people still outside Palestine of a formal charter making Palestine its preserve; immigration on a large scale would follow. The failure of his efforts to secure a charter, and his premature death in 1904, ultimately gave the victory here also to the tendency represented by the *Chovevê Zion*. Thus Zionism emerged from the seven years of Herzl's brilliant leadership with its pre-Herzlian philosophy and policy substantially unchanged, but with very

¹ The current translation "A Jewish State" is misleading. The prefix *Juden* has not the qualitative implications of "Jewish"; the German *Staat* does not connote political independence so definitely as the English "State"; and the emphasis in *Judenstaat* is on the first half of the compound, whereas in "Jewish State" it is inevitably on the second. "A Commonwealth of Jews" is a better rendering. This point is of some importance, because critics of Zionism have fastened on the term "Jewish State" as implying a desire to set up a State based on religious tests—than which nothing could be further from the idea of Herzl and of Zionists generally.

² *Öffentlich-rechtlich gesicherte Heimstätte* in the original German. The old translation "publicly and legally assured home" (see 28.988) is scarcely adequate. In article (4) of the Programme as there set out, "grants" should be replaced by "consents" (*Zustimmungen*). Zionism has never expected or asked for a financial grant from any Government.

considerable gains in organization, in prestige, and in the number and diffusion of its adherents. The movement had become world-wide; it had been recognized by the British Government (in the abortive offer of a territory in E. Africa, 1903) as representing the Jewish people; and it had become a powerful leaven in Jewish life, stimulating interest in Palestine and the revival of the Hebrew language in every Jewish community throughout the world. The Zionist organization, though it could not of itself bring about any serious political change in Palestine, was in a position to secure that, if and when the political future of Palestine became a practical question, the claims of Jewish nationalism should not go unheard.

Meanwhile it had to be content with the up-hill work of Palestinian colonization and the education of the Jewish people in the national idea. The number of Jewish agricultural settlements in Palestine grew from about 25 in 1904 to about 45 in 1914. The Hebrew school system developed rapidly, and the project of a Hebrew university in Jerusalem was definitely launched in 1913. The membership of the organization and the capital of the Jewish National Fund grew from year to year, and unorganized sympathy with the Zionist outlook and aims became more and more widely diffused.

The entry of Turkey into the World War called for a renewal of political activity on the part of the Zionist organization, as it obviously meant that the future of Palestine would before long come up for settlement. At the same time, the position of the organization was extraordinarily difficult. With adherents in all countries, both belligerent and neutral, it could not present a united front in international political questions, and the leaders of its various groups could not even take counsel together. The last biennial Zionist Congress had met in 1913; a Congress in 1915 was obviously impossible. Emergency arrangements were made to secure the existence of the organization, but for practical purposes it had to remain in suspense throughout the unexpectedly long period of hostilities. Meanwhile, the need for obtaining express recognition of Zionist claims became more pressing as a result of the British advance into Palestine in 1917. Relations with the principal Allied Governments had already been established, mainly by Dr. Ch. Weizmann and Mr. N. Sokolow, two of the Zionist leaders. As the outcome of protracted negotiations, in which Sir (then Mr.) Herbert Samuel played an important part, the British Government issued on Nov. 2 1917 the "Balfour Declaration," stating that they "view with favour the establishment in Palestine of a National Home for the Jewish people, and will use their best endeavours to facilitate the achievement of this object," and adding provisos to safeguard the rights of existing non-Jewish communities in Palestine and the rights and political status enjoyed by Jews elsewhere. The Allied troops entered Jerusalem soon afterwards (Dec. 9 1917), and in March of the following year the Balfour Declaration had its first practical outcome in the departure for Palestine of a Zionist Commission, which was to "act as an advisory body to the British authorities in all matters relating to Jews or which may affect the establishment of a national home for the Jewish people," and was charged with certain specific tasks in relation to the Jewish population of Palestine. The Commission remained in Palestine as the representative of the Zionist organization, and there directed such Zionist work as was possible during a period of unsettlement and restricted communications. In July 1918 it laid the foundations of the future Hebrew University on Mount Scopus.

The Turks were finally expelled from Palestine in Sept. 1918, and the Zionist policy of the British Government, which had in the meantime been endorsed by all the Allied Powers and by the President of the United States, had its logical outcome in the incorporation of the Balfour Declaration in the Treaty of Sèvres and the acceptance by Great Britain of a Mandate for Palestine on behalf of the League of Nations (San Remo, April 1920). The draft Mandate as printed in a Parliamentary White Paper (Cmd. 1176), recites in its preamble the substance of the Balfour Declaration, whereby "recognition has been given to the historical connexion of the Jewish people with Palestine

and to the grounds for reconstituting their national home in that country," and provides *inter alia* that the Mandatory shall be responsible for placing the country under such political administrative and economic conditions as will secure the establishment of the Jewish national home and the development of self-governing institutions (Art. 2); shall recognize an appropriate Jewish agency (provisionally the Zionist organization) as a public body for the purpose of advising and coöperating with the administration of Palestine in matters affecting the establishment of the Jewish national home (Art. 4); shall appoint a special Commission to study and regulate all questions and claims relating to the different religious communities (Art. 14); shall see that complete freedom of conscience is assured to all (Art. 15); and shall recognize Hebrew along with English and Arabic as an official language (Art. 22).

The frontiers of Palestine were defined in a separate convention between Great Britain and France dated Dec. 23 1920, and published in a White Paper (Cmd. 1105). In 1916, before either Government had come into close contact with Zionism, an Agreement (known as the Sykes-Picot Agreement) was made, dividing Palestine into a British and a French sphere of influence. This agreement needed revision in the light of subsequent developments, with due regard to both Arab and Zionist interests as well as to those of the two Powers concerned. The Convention of 1920 defines the frontiers of Palestine in such a way as to comply with the requirements of the historic phrase "from Dan to Beersheba," and to include in Palestine all the modern Jewish agricultural settlements, but not to give Palestine control of the sources of water power which are held to be necessary for its full economic development. On the other hand, the Agreement provides that Palestine is to have the use of the waters of the Upper Jordan and the Yarmuk and their tributaries, after satisfaction of the territories under the French mandate.

The draft Mandate for Palestine was attacked from three sides. Certain Palestinian Arabs, professing to speak in the name of the whole Arab population, objected absolutely to its Zionist provisions. A school of Zionists more or less in the line of the original Herzlian tradition complained that the draft Mandate gave too little to the Jewish people, and that the term "National Home" was too vague, and demanded that explicit provision should be made for the development of Palestine into a "Jewish State" within a fixed period. Lastly, some British politicians and newspapers attacked the Mandate on the grounds that it would involve the British taxpayer in expense with no corresponding return, and that it was unjust to impose a Zionist policy on the Arabs of Palestine against their wishes.

Despite these criticisms, there was every sign up to the end of 1921 that the Government intended to proceed in full accord with the spirit and the letter of the Balfour Declaration. Mr. Winston Churchill, the Secretary of State for the colonies, during his visit to Palestine in April 1921, emphatically declared that the Zionist policy of the Government remained unchanged, while assuring the Arabs with equal emphasis that their rights would be fully respected. The First High Commissioner, Sir Herbert Samuel, had won the confidence of all sections of the population by his impartiality.

Blondheim, 1918); Theodor Herzl, *Zionistische Schriften* (English translation of *Der Judenstaat* and of his Congress Addresses published by the Federation of American Zionists, 1917); Achad ha-Am, *Selected Essays*, translated by Leon Simon (1912); Richard Gottheil, *Zionism* (1914); Adolf Friedemann, *Das Leben Theodor Herzls* (1914); Kurt Nawratzki, *Die Jüdische Kolonisation Palästinas* (1914); *Zionism and the Jewish Future*, edited by H. Sacher (2nd ed. 1917; with bibliography); A. M. Hyamson, *Palestine: The Rebirth of an Ancient People* (1917); H. Sidebotham, *England and Palestine* (1918); Nahum Sokolow, *History of Zionism, 1600-1918* (2 vols. 1919; with bibliography); Norman Bentwich, *Palestine of the Jews* (1919); Shmarya Levin, *Out of Bondage* (1919); Leon Simon, *Studies in Jewish Nationalism* (1920); *Zionism* (Foreign Office Handbook, No. 162, 1920). There is also a voluminous periodical and pamphlet literature. *Zionism and the Future of Palestine* by Morris Jastrow, Jr. (1919) puts the "assimilationist" case against Zionism. (L. St.)

ZIRKEL, FERDINAND (1838-1912), German petrographer, was born at Bonn in 1838. He was educated at Bonn, where he trained as a mining engineer, but a journey he made to Iceland and the Faeroe Is., Scotland and England, and a meeting with Henry Clifton Sorby (see 25.431) attracted him to the study of microscopical petrography, then a comparatively new science. He became professor of mineralogy and geology successively at Lemberg (1863), Kiel (1868) and Leipzig (1870), retiring from the last-named post in 1909. He did much to develop the study of petrography, and his *Lehrbuch der Petrographie* (1866; 2nd ed. 1893-4) is a standard work on the subject. He was an hon. D.Sc. of Oxford, and also a foreign member of the Royal Society and an hon. member of the Mineralogical Society. He died at Bonn June 11 1912.

ZOBEIR RAHAMA (1830-1913), Egyptian pasha (see 28.992), died at Geili, near Khartum, Jan. 5 1913.

ZOOLOGY (see 28.1022).—It is a sign of the vitality of a science such as zoölogy that its aspect should change from generation to generation. Paths of inquiry which are eagerly followed for one quarter of a century are sometimes almost forsaken during the next. There is change of emphasis and perspective. The reasons for this are mainly four. (1) A great discovery, such as Mendel made, opens up the possibility of conquering a territory hitherto unsubjugated, and this secures the enthusiasm of pioneers. (2) A new idea, such as that of discontinuous variations or mutations, alters the traditional outlook and is bound to affect zoölogical activity, e.g. taxonomy in the case mentioned; or a new scepticism, e.g. in regard to the transmission of exogenous somatic modifications ("acquired characters"), may prompt effort in reinterpreting facts. (3) A new contact, such as is suggested by the terms biochemistry and biophysics, biopsychology and psychobiology, always means a fresh series of formulations, making, in synthesis, for a more complete apprehension of that well-integrated unity—the Organism—which the various analytic methods seek to understand from different points of view. (4) A new method—such as section-cutting, differential staining, the use of the ultra-microscope, the utilization of statistics—may prove so rewarding that it attracts many recruits to its service, with the result that the trend of zoölogy is for a time markedly in that direction. There are other factors which change the aspect of zoölogy from generation to generation, such as the influence of great masters, like Huxley, Balfour, and Lankester; and the claims of the nation for scientific counsel, e.g. as regards agriculture, breeding, fisheries, and insect-pests. Moreover, the reflective intelligence of the scientific workers themselves, who have an ideal of the unity of their science, makes them tend, deliberately or subconsciously, to fill up gaps, as may be illustrated by the relatively recent development of the scientific study of animal behaviour.

For such reasons as have been indicated the aspect of zoölogy has changed considerably since the opening of the 20th century, though it may be safely said that the things that remain much the same are of more importance than most of the novelties. Of some of the significant new departures, which led to notable results in the period 1910-21, account is taken in separate articles, e.g. under BEHAVIOURISM, BOTANY, CYTOLOGY, ECONOMIC ENTOMOLOGY, MEDICAL ENTOMOLOGY, EMBRYOLOGY, SEX, GENETICS, MENDELISM, PROTOZOOLOGY. What is attempted in the present article is a general survey, which may be conveniently arranged under the headings: Morphological, Physiological, Embryological and Aetiological (Evolutionary).

(A) MORPHOLOGICAL ZOOLOGY

In its full scope morphology has to do with the static relations of organisms, with form and structure, as contrasted with physiology, which is concerned with the dynamical problems of vital activity. The two inquiries are obviously complementary and indispensable. It is a narrow view which affects to despise "purely morphological research"; as is obvious enough when any distinctively new type, like the sedentary ctenophore *Tjalfiella*, or the elusive *Okapi*, comes under consideration. Yet

it must be admitted that zoölogical activity has in some measure turned aside from accumulating details of comparative anatomy at any and every level of analysis. As a discipline descriptive morphology is indispensable, but it is not to be persisted in too long, when there is so much else awaiting investigation. There is a widespread and not unreasonable opinion that morphological researches require some justification beyond their immediate result; they should contribute to our knowledge of affinities, of adaptations, of principles of architecture, and laws of change, as the best morphology has always done.

Causal Morphology.—The distinctive modern change has been the coming together of physiology and morphology, which developed for so long on paths that seldom even crossed. As E. S. Russell says, in his scholarly and critical *Form and Function* (1916), "Until well into the 'eighties animal morphology remained a purely descriptive science, content to state and summarize the relations between the coexistent and successive form-states of the same and of different animals. No serious attempt has been made to discover the causes which led to the production of form in the individual and in the race" (p. 314). The evolution theory offered only a formal solution, and for all practical purposes physiologists took the animal organization as given, not troubling about its mode of origin. Not a few saw the need of definitely tackling the physiology of development, notably Prof. W. His, in his well-known work, *Unsere Körperform und das Problem ihrer Entstehung* (1874), but the credit of founding a new sub-science of causal morphology (*Entwicklungsmechanik*) on an experimental basis certainly belongs to Prof. W. Roux, who has had many followers. The aim of *Entwicklungsmechanik* is defined by Roux to be "the reduction of developmental events to the fewest and simplest causal processes." Two classes of causal processes may be distinguished, as "complex components" and "simple components" of development. "The latter are directly explicable by the laws of physics and chemistry; the former, while in essence physico-chemical, are yet so very complicated that they cannot at present be reduced to physico-chemical terms. . . . They represent biological generalizations, in their way of equal validity with the generalizations of physics and chemistry" (Russell, 1916, p. 319). They are, in fact, the general properties or functions of organized matter, such as assimilation and dissimilation, growth and reproduction, heredity and self-differentiation.

Biophysics.—A special department of causal morphology may be usefully designated biophysics. As in regard to chemical processes, so in regard to physics, there is great promise in those investigations which carry up into the study of organisms the laws and lessons of the inorganic. An auspicious beginning of this difficult task has been made by Prof. D'Arcy W. Thompson, in his *Growth and Form* (1917), one of the foundations of biophysics. The aim of this inquiry is "to show that a certain mathematical aspect of morphology, to which as yet the morphologist gives little heed, is interwoven with his problems, complementary to his descriptive task, and helpful, nay, essential to his proper study and comprehension of form." Factors to be reckoned with are size, the principle of minimal areas, surface tension, equilibrium, the rate of growth in different directions, and the properties of colloids. The essay marks a big advance in the interpretation of form, whether in external structures like molluscan shells, the twisted horns of mammals and the shapes of eggs, or in internal architecture, like that of a bone, where static and dynamical principles find fine illustration. Luminous also is Thompson's theory of transformations, in which it is shown how a single harmonious deformation may lead from one form of skull or leaf to that of a related type; and how trammels or lines of constraint may determine the action of the expansive forces of growth, now in one direction and now in another. This is more than an approach to the principles of morphogenesis.

Let us state this step of progress concretely. Exact study has shown that the thigh-bone, for instance, is in its proportions and structure mechanically correct. It has great strength with a maximum economy of material, and the internal beams are in their thickness and closeness of spacing demonstrably adjusted

to the intensity of the stresses to be withstood. So far well; but the further step is to utilize the principles of physics in accounting, as far as may be, for the vital architecture. A guillemot lays a single top-shaped egg on a narrow shelf of a precipitous sea-cliff. Now Darwin pointed out that when an egg of this shape is roughly jostled by the wind or by the parent bird, it will rapidly rotate on its short axis, but will not roll away from the spot. The mechanical adjustment is simple and effective, but the further question is how far the adaptive result can be accounted for in terms of the physical conditions of pressure, surface-tension and the like, operative on the egg-shell while it is still in the making in the oviduct. It is for the student of biophysics to work this out.

Enough is not yet known of the possibilities of another line of physiological morphology, represented by the work of Prof. C. M. Child, *Individuality in Organisms* (1915), which seeks to interpret structural differences in terms of different rates of metabolism at the various levels or "gradients" of the axis of body-symmetry.

Homoplastic Structures.—Criticism of the concept of homology (resemblance in embryonic origin and fundamental structure) has brought into prominence the kind of resemblance which Sir Ray Lankester called "homoplasy," to which others have applied other terms, such as "convergence." It is a resemblance in types not closely related, and is due to the similar adaptation of non-homologous structures to similar conditions of life. But it is plain that the idea requires careful handling. There are cases where homologous parts become adaptively very like one another, directly or indirectly in relation to similar functioning, as in the case of the "paddles" of ichthyosaurs, turtles, penguins and cetaceans. To such cases it has been proposed to apply the term "parallelism," while Prof. Gadow (1913) has carried the analysis further, distinguishing "isotely" (hitting the same mark), e.g. zygodactyl feet of cuckoos, parrots, and woodpeckers, from "homacotely" (hitting the same target, but not quite the same mark), e.g. the jumping foot of kangaroo, jerboa and Tarsius. Both of these have to be clearly separated from what many call true convergence, which Prof. Gadow has called "parately," where the feature has been evolved from parts and material so different that there can be little relationship, if any. The resulting resemblance is more or less superficial. Thus the bivalve shell of Brachiopods has nothing to do with that of Lamellibranchs, and the *bullae auris* of certain extinct reptiles (Pythonomorpha) is probably the quadrate, while that of the cetacea is the tympanic. Similarly, it is probable that the eye was evolved many separate times. Now the well-marked convergence or homoplasy of non-homologous structures depends on a coöperation of factors: e.g. (a) the widespread occurrence of certain similar hereditary factors which will respond much in the same way to similar environmental conditions; (b) the plastic power of similar functioning, operating in individual development; and (c) the similarity in the sifting process of natural selection. Along with (a) may be included the idea that the number of new departures is probably far from being unlimited; along with (b) may be included the idea that the biophysical conditions of stability are within relatively narrow limits; and along with (c) the similar moulding of similar functions may be included, as Gadow says, the subtle effects of correlation. It is probable that the continuation of the interesting study of convergence, along the lines indicated by Lankester, and more fully by Willey and Gadow, will lead to a deeper understanding of the principles of organic architecture or morphogenesis. It may also throw some light on classification, for it is worth considering whether the same congeries of characters may not arise more than once, and that not fortuitously. Prof. Gadow refers to his finding in Mexico the burrowing snake, *Typhlops braminus*, previously known from islands and countries of the Indian Ocean basin, a fact which suggests to him that the species had evolved twice. Some would say indeed that three similar domestic dogs might be traced to three different ancestors, a coyote, a jackal, and a wolf. The question also arises whether this promising study of convergence or homoplasy will not

also elucidate close pattern-resemblances between forms, in regard to which it is impossible to suggest any genuine mimicry.

The Question of Species.—A huge number of new species of animals are described annually, sometimes several thousand insects in one year. When a collection has to be reported on or a new region explored, there is obvious need for the old-fashioned definition of new species, i.e. forms which do not conform to any previously described. To give one of these novelties a new name, if it is marked off by peculiarities of some magnitude (necessarily to some extent a matter of opinion), is practically a much more desirable procedure than the restraint which says: "*Mus n. sp.*, in the vicinity of *Mus sylvaticus*," for this makes subsequent reference intolerably tedious. But several changes may be detected in the zoological species-making of to-day. (1) There is no longer much enthusiasm for this line of activity in itself. It is a necessity, a useful discipline; but there is no particular hurry in completing the descriptive catalogue; there are more urgent affairs. (2) The task is now approached with a deeper sense of responsibility, for it is recognized that every peculiarity does not mean a new species. Many peculiarities are transient somatic modifications which are repressed on successive generations as long as the same incident factors are operative. Other peculiarities are not beyond the range of the variations which occur within the limits of one family, the progeny of one pair. It is a pious opinion that a new species should be based on numerous specimens, and that something should be known of the genetic behaviour of its peculiarities. (3) More attention is being given to the occurrence of variations and mutations, which, instead of being put in a corner as inconveniences, are now regarded as of no less interest than the rank and file of the species. Polymorphic species, like the ruff, are more interesting biologically than relatively fixed species like the pheasant. (4) But along with this increased and more analytic attention to variations, which have to be studied from the point of view of genetics, and if possible experimented with, there is an increased recognition of the other side—the discontinuity or apartness of species. It is difficult to maintain that the category *species* is univalent throughout, e.g. that it has the same value among micro-lepidoptera as it has among birds, but in all sound taxonomy a species is marked by its definite specificity. The tendency is toward a recognition of fixity as even more characteristic than flux. In many cases it seems safe to say that species differ in the presence or absence of unit characters, or in the arrangements of their unit characters, whose gametic factors exhibit Mendelian behaviour. (5) If species differ, like a series of organic compounds or like a series of related minerals, in their internal constitution, then it is no longer necessary to insist on the utilitarian value or adaptive significance of the specificities. That specific characters are often adaptive seems undeniable; that they need have this value is highly improbable (see Bateson, 1913).

Taxonomy Criticised.—Supposing the most satisfactory description of a new species, based on numerous specimens living in known environment, and supposing even some acquaintance with the genetics of the species, we must face the further question whether zoological work at this Linnaean level is worth while. It is in a way hodman work, though few do it very well. It is very quantitative work, adding leaves to inherited monographs. It tends to preoccupy the investigator, leaving him with little time or inclination for more adventurous pursuits. It leads to little in itself. Thus there is a widespread conviction that the day of the pure systematist is past, and should be declared as past.

But this is perhaps not more than a wholesome rebound from an unsatisfactory species-mongering. In any case there is another side to the criticism. If a region is to be surveyed in a business-like way, e.g. the Zoological Survey of India initiated and directed by Dr. Nelson Annandale, there must be a perfectly precise census. For practical purposes it is indispensable that there be no vagueness about the species of (say) mosquito and tick. The meticulous thoroughness, sometimes scoffed at by the impatient, may save the lives of thousands. Moreover,

a new type with real taxonomic importance comes every now and then as the reward of drudgery. Nor can it be doubted that an evolutionary study of species, especially when it can be linked to genetic studies of the living material, may lead us nearer the main object in view—the understanding of life. Educationally, it may be doubted if the Linnaean discipline of species-making can be dispensed with without serious loss of efficiency.

Palaeontological Study.—The *differentia* of palaeontology is that it studies organisms in their time relations, in their genetic sequence from age to age. A taxonomy based only on a study of forms extant—"a horizontal section across the tree of life"—may be shrewd, but it is incomplete without the work of the palaeontologist who exposes the relations of the buried branches. It is certain that palaeontological research has done well by zoölogy in this respect, as may be well illustrated by the later work of Prof. D. M. S. Watson on the taxonomy of amphibians, reptiles and mammals, or by the magnificent history of the extinct Equidæ which has crowned the labours of Prof. H. F. Osborn.

Another achievement of the palaeontologists has been their increasingly satisfactory vindication of evolution as a historic process. Thus, to quote Dr. F. A. Bather (1920, p. 67): "if we take a chronological series of apparently related species or mutations, a^1 , a^2 , a^3 , a^4 , and if in a^4 we find that the growth-stage immediately preceding the adult resembles the adult a^3 , and that the next preceding stage resembles a^2 , and so on; if this applies, *mutatis mutandis*, to other species of the series; and if, further, the old age of each species foreshadows the adult character of its successor; then we are entitled to infer that the relation between the species is one of descent." This method of proving filiation is clearly illustrated by work on Ammonites. "Thus, large ammonites of the *Xipheroceras planicosta* group, beginning smooth, pass through a ribbed stage, which may be omitted, through unituberculate and bituberculate stages, back to ribbed and smooth again" (Bather, 1920, p. 68).

It is clear that taxonomic categories based on the study of existing forms must be supplemented by new categories disclosed by the palaeontologists' study of change in time. "Thus many crinoids with pinnulate arms arose from others in which the arms were non-pinnulate. We cannot place them in an order by themselves, because the ancestors belonged to two or three orders. We must keep them in the same orders as their representative ancestors, but distinguish a *Grade Pinnata* from a *Grade Impinnata*" (Bather, 1920, p. 63).

To the palaeontologists are due, we think, convincing proofs that evolutionary change may be sometimes continuous, by gradual transition rather than by saltation. In their contributions to such problems as orthogenesis, the rise and decline of species, the tempo of evolution, and the correlation of organic with cosmic changes, the palaeontologists have certainly kept pace with the "neontologists."

Animal Histology.—Without unduly trespassing on the article CYTOLOGY, we may indicate some general features of recent progress in animal histology. (a) The concept of the cell has become more fluid; for we recognize cells without very definite limits living in syncytia, cells with protoplasmic bridges binding them to their neighbours, cells with nuclear dust instead of a nucleus, and so on. Many zoölogists agree with Prof. Clifford Dobell that to speak of a Ciliated Infusorian (let us say) as a single cell is more misleading than useful. It is rather a non-cellular than a unicellular being; it has not entered upon the cellular line of evolution; it is a complex organism with much division of labour, and no Metazoan cell can be said to be on a par with it. Similarly, it is a suggestion of a fallacy in calling an ovum a single cell; for it has a complexity beyond imagining, it is a highly endowed implicit organism. (b) It is no longer easy to be satisfied with the oft-repeated comparison of a multicellular organism to a colony or regiment of cells. It has become clearer that cellular structure is largely a segregating device for the better working of that division of labour which the intricacy of vital processes demands. (c) If we take as a good example the recent *Introduction to Cytology* (1920) by the late Prof. Doncaster, we find that our picture of the animal cell has become extraordi-

narily complex. In the cell-substance or cytoplasm there are in many cases definitely formed granules or rods (mitochondria) which sometimes have to do with the formation of particular protoplasmic products; there are very frequently strands or rods of the "Golgi apparatus," the significance of which is very obscure; there are also "chromidia" which sometimes appear like migrants from the nucleus attempting to colonize the cytoplasm. In the centre of the cytoplasm floats the nucleus, microcosm within microcosm. It has its differentially permeable membrane; its chromosomes, usually definite in number for each species; its nucleolus, which may be a karyosome of chromatin or a plastosome of plastin; and the karyolymph, bathing both chromosomes and nucleoli. Then there are the centrosomes, which play an important part in organizing the process of nuclear division. But this is not nearly all, for each chromosome is like a necklace of beads threaded on a transparent ribbon of linin, and these beads or microsomes are probably the biological units of the lowest visible grade. In curiously indirect ways it seems possible (Morgan, 1919) to make a sort of map of the chromosomes of an egg-cell, and to say, for instance, that such and such hereditary factors of the fruit-fly *Drosophila* are located in the upper third of the second chromosome. In some cases it is possible to tell from visible peculiarities in the chromosomes of a fertilized egg-cell whether it would have developed into a male or into a female. These are but illustrations of the increasing precision. (d) In another direction, however, modern work has led to simplification, namely as regards cytoplasmic structure. The 19th-century histologists accepted with little question the view that the reticular, fibrillar, or other fine structure seen under high power in fixed and stained cells corresponded to a genuine architectural complexity in the living cell. But the work of Hardy (1899) and Fischer (1899) showed that the alleged structure is mainly of the nature of artefact, and that different structure is revealed according to the histological methods used. The use of the ultra-microscope has confirmed the conclusion that protoplasm in a living condition is a structureless fluid with particles and droplets in a freely movable state—a colloidal system in short. There must be arrangements which permit of the simultaneous occurrence of very different chemical processes in adjacent parts of the cell, but this is not of the nature of a visible cytoplasmic architecture, and it may be of the nature of a temporary gelation (see Bayliss, 1915, chap. 1.). (e) Just as the early microscopists described and figured many structures under magnification without making them more significant or intelligible, so in the immense library of zoölogical histology there is a prodigious amount of meticulous description that is not very illuminating. Too much of it has been a registration of artefacts; and it may be fairly noted as characteristic of recent years that mere micrography is finding fewer devotees. The achievements of differential staining are giving place to a reasonable biochemical microscopy. For it is plain that the analytical study of minute structure does not justify itself—apart from demonstrating specificity and a succession of plasmic phases—unless it throws light on what happens in the cell-laboratory—the oxidations and reductions, the hydrations and condensations, the synthetic and analytic processes which constitute vital metabolism. These chemical reactions take place with extraordinary speed, which is conditioned by the activity of enzymes, and also with not less extraordinary orderliness, which is conditioned by some localizing (as it were insulating) arrangements of the colloidal system of the cell. But an analogy probably more fitting than that of a laboratory is that of a factory, for it seems clear that cytoplasm, nucleus, centrosomes, mitochondria and so forth are working together, and potent in their inter-relations.

Thus, to take an obvious case, there appears to be, as Richard Hertwig and others have emphasized, a definite volumetric ratio between the nucleoplasm and the cytoplasm of the cell. Interesting results have also rewarded the inquiry into the changes in this relation which occur in regenerative processes, in the growth of tumours, in the segmentation of the ovum, or when a microbe enters a cell, and disturbs its equilibrium.

(B) PHYSIOLOGICAL ZOOLOGY

Along the line of comparative physiology the rate of progress during the last 20 years has not been proportionate to the importance and attractiveness of this line of investigation. There have been many individual researches of value, but there has been no adequate continuation of the broad and well-conceived work of Krukenberg 30 years ago. The difficulty is that few zoologists are expert in biochemistry, without which many paths of physiological research are impassable, and that few biochemists are aware of the many and pressing zoological problems that promise great results. It may be doubted whether in the whole range of zoology there is any kind of investigation more likely than comparative physiology to yield new knowledge of first-rate importance. Just as the discovery of the significance of the glands of internal secretion (suprarenals, thyroid, etc.) has profoundly influenced the physiology of the vertebrates, so will a deepened physiology of the invertebrata modify the whole science.

Recent Advances.—Although we are still awaiting concerted prosecution of comparative physiology, there have been numerous advances of great interest, of which two or three illustrations must suffice. (a) G. H. Parker's working-out of the various grades of nervous activity exhibited by a series of animals from sea-anemone upward is a good example of a physiological inquiry of immediate interest in itself and also important in its bearing on the evolution of behaviour. (b) The continuation of the study of animal pigments may be illustrated by the work of Oscar Riddle, and not less interesting are such investigations as those of Gamble on the Aesop Prawn, of Sumner on the changeful patterns of flat-fish (see COLOURS OF ANIMALS), and of Minkiewicz on the apparent colour-disguises which some crabs find in the seaweed with which they mask themselves. (c) Also very promising is the inquiry (e.g. by Holmes and Schmidt) into the varied phenomena of "death-feigning." There is a prospect that it may be possible to arrange these in a series. Beginning with the sudden stoppage seen when the animal passes abruptly into a new medium we are led on to the spontaneous catalepsy of some Phasmids, and thence to "animal hypnosis," and to the subtler forms of death-feint in various birds and mammals. On another series it may be possible to arrange a succession of physiological states, such as extreme fatigue, auto-intoxication, cold-coma, sleep, hibernation, and so on to latent life. Further study of latent life is desirable.

Hormones and Chalmers.—As was to be expected, the physiological discovery of the significance of the organs of internal secretion (ductless glands) has had its influence on zoology. The fact that stimulating hormones and quieting chalmers produced by these ductless glands are distributed through the vertebrate body by the blood, and secure an integration hardly less important than that effected by the nervous system, has shed a flood of light on the functional correlation of parts. The idea of a regulative system is far-reaching. (a) It is of importance in connexion with growth and development, as studies of the pituitary body show. (b) It sheds light on the ante-natal symbiosis characteristic of mammals, for it is known that hormones pass through the placenta not only from mother to offspring, but from offspring to mother, to the great advantage of both. In such ways clues are being discovered which make it possible to understand how the uterus is prepared for the ovum, and how the milk is ready for the new-born mammal. (c) The whole dark subject of secondary sex-characters in animals has been illumined by the discovery of gonadial (testicular and ovarian) hormones which activate the development of the distinctive secondary characteristics of male and female. The internal secretions which pass from the ovary of a duck determine the development of feminine characters and the inhibition of masculine characters. The latter normally remain latent, but if the ovary be removed the duck becomes a more or less perfect imitation of a drake of the same race; and this assumption of masculinity may affect behaviour as well as plumage (Goodale, 1916). (d) When acid gastric contents reach the duodenum there is produced in the intestinal wall a hormone

which the discoverers (Bayliss and Starling, 1902) called "secretin"; it is carried by the blood to the pancreas, where it provokes a greater production of digestive ferments which are carried by the pancreatic duct to the duodenum, there to discharge their appropriate function. It is for the zoologist to discover similar automatic regulative processes; and the quest for hormones in invertebrates, suggested by the work of J. F. Gaskell (1914) on the leech, is very attractive. Such an everyday incident as the cat's hairs "standing on end" when surprised by a dog admits of obvious interpretation in terms of the hormone of the suprarenal bodies.

Ecology.—The old "natural history" cultivated a profitable field—the study of the life of organisms in its interrelations, as it is lived in wild nature. Logically classified, it was an enquiry into "the higher physiology," that interplay of organisms, where account has to be taken of more than the internal economy of the individuals concerned. For if physiology be the study of the organism in its dynamic relations it must include the serious study of the intact creature in its natural surroundings, as one of a pair and of a family, as a member of an association and of a fauna. This ecology (or "bionomics") is the oldest department of the science and it is indispensable; the question is how that of to-day differs from Réaumur's or Gilbert White's.

(a) Largely through Darwin's influence, there has been an increasing recognition of the complexity of interrelations amid which the organism lives and works. The recognition of the correlation of organisms has been not less profitable than the recognition of the correlations of organs within the body. It is not merely that, for completeness' sake, insects must be studied in relation to the flowers they visit, and the bird in relation to its mate and family, its "territory" and migrations—there is yet more implied in the modern insistence on the concept of "the web of life." As Darwin indicated, it deepens our understanding of natural selection in the struggle for existence. "For in the gradually evolved and ever complexified system of interrelations there is a sieve of extraordinary delicacy, which discriminates between even minute variations to the plus or minus side" (Thomson, 1919, p. 95). Moreover, part of the difficulty of understanding the frequent and general progressiveness of evolution (in the direction of increasing differentiation and integration) may be found in the gradual complexifying of the web of life, e.g. in the linkages between flowers and their insect-visitors. "There is established an external system of interrelations which is always becoming more intricate, and this forms the sieve by which variations are sifted. There has been an evolution of sieves which partly accounts for the progressive evolution of the sifted" (Thomson, 1919, p. 96). The importance of recognizing animate interrelations is familiar.

(b) Modern "natural history" has become frankly evolutionary. The "*Souvenirs Entomologiques*" of Henri Fabre must be taken as the crowning work of the older school; unquestionably an achievement of genius when we consider the patience, ingenuity, and intimacy of its observation, behind which lay an emotional sympathy, bringing, at times, even scientific reward, and yet an achievement robbed of its fruition by the observer's refusal to take Darwinism seriously, and by an unprofitable pessimism as to the possibility of any evolutionary interpretation whatsoever. A more progressive note is sounded in modern work permeated with the evolution-idea, such as Wheeler's studies on ants or Roubaud's on wasps.

(c) A third change, and a welcome one, is that "natural history" is becoming more analytic—which will eventually mean a fresh synthesis. Thus the study of the migration of birds, for so long rather fumbling and anecdotal, has entered on a new phase of precision. This may be illustrated by Dr. Eagle Clarke's careful analysis (1912) of enormous masses of observational material, the utilization of a new ringing method (Landsborough Thomson, 1921), and by the precise experiments of Watson and Lashley (1915) on the homing of terns at the Tortugas.

Another illustration will be found in the still incipient endeavour of the shrewder observers to take advantage of the results of the modern study of animal behaviour. The older

naturalists read the man into the beast without let or hindrance or else reacted to the other extreme of regarding animals as automata. It is now recognized as desirable that an attempt be made to describe behaviour with reference to definite categories, of intelligence, instinct, individual habitation, association, tropisms, reflexes, and the like. To mention what may seem at first sight a small matter, Miss Frances Pitt (1920), in studying the well-known method the thrush adopts of breaking snails' shells on a stone-anvil in the wood, takes the trouble to experiment with a young thrush to see whether the behaviour is instinctive or whether it has to be learned. Her account of the bird's gradual learning, by a "trial and error" method, is of real scientific value.

Luminescence.—There is definite progress to record in the study of many animal activities which stand somewhat apart from the everyday life of the body. The inquiry into the nature of animal luminescence is a case in point (see Harvey, 1920). Luminescence is known to occur in no fewer than 36 orders of animals; it is a chemical phenomenon that may manifest itself after life has ceased (bacteria apart); it may be produced *in situ* in the cells in which the photogenic substance is produced, or there may be a luminous secretion that exudes over the surface of the body and forms a glimmering trail in the sea or on the ground; it may have its seat in more or less elaborate luminous organs which often show a remarkable convergence to eyes (the chemiphotic approaching the photochemical). The production of the animal light may be continuous or it may be periodic and even rhythmic. In "fire-flies" the light consists wholly of visible rays, with no infra-red or ultra-violet, and none of the energy is lost in the form of heat. It is practically perfect "cold light." The matter has been probed furthest in Lampyrid beetles, in the small crustacean Cypridina, and in the boring bivalve Pholas, and the result has been to confirm the contention of Raphael Dubois (1887) that a protein substance, luciferase, acts, in the presence of oxygen and water, on another substance, luciferin, which has much in common with peptones. The luciferins of different luminescent animals are different, but all luciferins have a good deal in common, and it is the same for the luciferases. It is probable that luciferase is an organic enzyme or catalyst which oxidizes luciferin, or accelerates its oxidation, with the result that light is produced. It is interesting that the chemical physiology of animal light has outrun its ecologic interpretation. In some cases the light may be no more than the byplay of some physiologically important chemical change, but a biological interpretation is demanded when there is an elaborate luminous organ or a definite arrangement of organs. Unfortunately, however, the interpretations suggested remain more or less of a speculative nature. The light may scare away intruders; it may be a lure attracting booty; it may illumine the surroundings; it may facilitate the recognition of kin; and it may serve as a sex-signal in mating. What seems a physiological byplay has thus been utilized and elaborated in quite different directions.

Tropisms.—On the inclined plane of animal behaviour tropisms occupy a place somewhat above ordinary reflex actions, and it is certain that an understanding of the ways of animals is impossible unless the role of tropisms is duly appreciated. This need not involve an attempt to coerce behaviour of a higher order (e.g. implying intelligent control) into categories manifestly too small—an exaggeration which sometimes seems to attend the brilliant experimental work of Jacques Loeb (1918). Yet tropisms must be taken account of, and Loeb has shown that they are obligatory or forced movements of the animal as a whole, which more or less automatically secure physiological equilibrium in relation to outside stimuli, such as light or heat, gravity or electricity, diffusing chemicals or water currents. When a moth, constitutionally adapted to nocturnal activity, but positively heliotropic none the less, comes in its flight within the sphere of influence of a lit candle, and has one eye much more illumined than the other, owing to the direction in which it happens to be flying, more intense chemical processes are set up in the more illumined eye. This means that on the illumined

side there is a relative increase in the mass of certain chemical products. But stimulations are always passing from the brain of the flying moth to the contracting muscles, and if the physiological symmetry of the brain has been disturbed by the unequal illumination of the eyes, the muscles on the more illumined side are thrown into a state of stronger tonus, with the result that they respond more forcibly to nervous stimulation, and therefore turn the head and body of the moth directly toward the candle near which it is flying. "As soon as the plane of symmetry goes through the source of light, both eyes receive again equal illumination, the tension (or tonus) of symmetrical muscles becomes equal again, and the impulses for locomotion will now produce equal activity in the symmetrical muscles. As a consequence, the animal will move in a straight line to the source of light until some other asymmetrical disturbance once more changes the direction of motion" (Loeb, 1918, p. 14). When elvers go straight up stream against the current, when small crustaceans crowd to the shaded or to the warmer corner of the aquarium, when newly hatched turtles make for the sea, we have to do with tropisms. In many cases, however, even among the lower animals a higher note seems struck. For Jennings (1906) there is trial after trial of different movements, and there is a selection of that which brings relative satisfaction; an interpretation to which this observer adheres, despite criticism from Loeb.

Zoological Parasitology.—Progress in the study of parasites has been a very marked characteristic of the zoological work of recent years. This is congruent with the increased attention that has been given to the broad fact of the inter-relations between organisms, and details of the important medical results achieved will be found in the separate medical articles on this or that form of parasitic disease (e.g. MALARIA, SLEEPING-SICKNESS, BILHARZIOSIS, etc.). The tracking of the life-history of parasites is but a particular instance of this kind of investigation, with a special interest when the parasites affect Man and his domesticated animals and cultivated plants. Good examples are not far to seek—the malaria organism (plasmodium), and the mosquito's share in its development and dissemination; the trypanosomes that cause sleeping-sickness and other diseases, and the tsetse flies and other insects implicated in their transmission; the hookworms (*Ankylostoma* and *Necator*) which depress the vitality of enormous numbers of the inhabitants of tropical and sub-tropical countries; and the species of the formidable Bilharzia (*Schistosomum*) whose life-history, discovered by Dr. Leiper, is bound up with freshwater snails. Apart altogether from the immense practical importance of these investigations, they are full of theoretical interest. Thus, to take the two kinds of Bilharzia in Egypt, one species, *Schistosomum mansoni*, has ova with a lateral spine, is chiefly associated with the snail *Planorbis*, and produces intestinal bilharziosis; while the other species, *S. Haematobium*, has ova with a terminal spine, is chiefly associated with the snail *Bulinus*, and produces renal bilharziosis—obviously a fine instance of specificity. As several human diseases have now yielded to attack from the zoological side, it is not over-sanguine to consider whether there may not be a much-desired clue in the fact that cancer of the stomach of the rat is produced by a nematode whose carrying host is the American cockroach. Very interesting and somewhat surprising is the discovery (see Rennie, White, and Harvey, 1921) that the so-called "Isle of Wight disease" in hive-bees, which spread in a few years all through Britain, is causally connected with the presence of a minute mite, *Tarsonemus woodi*, in the cavity of two anterior tracheæ. More familiar is the demonstration of the fact that true pearls may have a parasitic origin.

(C) EMBRYOLOGICAL ZOOLOGY

While descriptive morphological embryology continues on lines which require no vindication—we have only to think of recent work on the development of the marsupials and armadillos, of Dipnoi and Echinoderms—it is instructive to notice in the volumes of the *Journal of Experimental Zoology* how many embryological investigations sound the experimental note. There has been great activity not only as regards what is often called

"experimental embryology" in the narrow sense, where germ-cells and developing ova are subjected to artificial stimuli, constraints, and disturbances, but also as regards later stages of embryonic life. Here might also be considered the observations of Carrel and others on the prolonged life of pieces of tissue in artificial cultures, and the important researches of Ross Harrison on the growth of a nerve fibre. It is of zoölogical as well as physiological interest that this growth should be closely comparable to the protrusion of a pseudopodium by an amoeba.

Experimental Embryology.—In illustration of what may be included under the term "experimental embryology," we may take Godlewski's remarkable cases of the fertilization of an ovum with the spermatozoon of an unrelated animal. A fragment of the ovum of *Echinus*, bereft of a nucleus, was fertilized by the spermatozoon of the Crinoid *Antedon*. The segmentation, the gastrulation, and the formation of the mesenchyme followed the type of the maternal parent, which seems to show that the cytoplasm may count for much in inheritance. The ova of *Sphaerechinus* were fertilized by the spermatozoa of the Annelid *Chaetopterus*, and the union of the two nuclei was observed. But before the nucleus divided, the chromatin from the spermatozoon was ejected, as if the incompatibility was too pronounced. In another set of experiments Godlewski altered the composition of the sea water containing sea-urchin ova, and then introduced the spermatozoa of *Chaetopterus* or of the mollusc *Dentalium*. The result was development, which was followed to the Pluteus stage. The further experiment was made of adding spermatozoa of the sea-urchin to those of the worm or of the mollusc, with the result that no development occurred. Godlewski speaks of the antagonism of the unrelated spermatozoa, and Bohm (1921, p. 27) calls attention to the possible analogy with the antagonistic action of serums derived from distantly related species. Nothing, he says, is more fruitful in biology than the bringing together of two sets of facts which appear at first sight to belong to very different provinces. Enough has been said to indicate the interest of this relatively young inquiry.

Artificial Parthenogenesis.—It was discovered independently by Yves Delage and by Jacques Loeb that ova which do not normally show parthenogenetic or aspermic development may be induced to do so by very varied artificial stimulation. The prosecution of this kind of experiment has made it plain that there are usually two distinct events—the first, a stimulation which induces cleavage but is apt to lead to disintegration; the second, a counteracting or corrective influence which steadies development, acting as a life-saving brake. Thus, to take one of Loeb's methods, if the eggs of the sea-urchin are subjected for a short time to the influence of some fatty acid like butyric acid, cleavage sets in, but it is then necessary to place the ova in hypertonic sea water to keep them on lines of safety. Or, to take one of Delage's methods, the ova may be first activated by a combined application of tannin and ammonia, and then replaced in ordinary sea water. Or, to take Bataillon's method, if the eggs of the frog are first activated by pricking them with a very fine stilet of glass or platinum, and then steadied by washing them with blood, which allows of the entrance of a corpuscle, normal development may follow, and several young frogs, of both sexes, have been reared.

Experimental Teratology.—A good instance of the modern endeavour to supplement the study of form by the study of function, morphology by physiology, may be found in the development of experimental teratology. Accurate descriptions of monstrosities and abnormalities are valuable, but their significance is increased when some light can be thrown on how the peculiarities in question came about. It has been shown that defective nutrition of the embryo, especially at critical stages, may lead to "arrests of development," such as harelip in Man. It has been shown that conditions which bring about local slowing or quickening of the rate of development may result in abnormal asymmetry, coalescence, separation, and the like. But a more precise illustration may be useful. Dr. E. I. Werber (1916) subjected the developing eggs of the American minnow, *Fundulus*, to various reagents, such as butyric acid, which

brought about numerous monstrosities in eyes and ears, nostrils and mouth, heart and fins. The chemical intrusion seemed to dislocate and partially dissolve the germinal material, especially toward the head end of the embryo. As one of the results of a disturbance of carbohydrate metabolism is the production of butyric acid, the theory almost suggests itself that a poisoning of a mammalian mother's constitution with butyric acid might account for histolytic monstrosities in the offspring. Werber has also shown that a breaking-up (blastolysis) of the optic club brings about the formation of many lenses. The optic club fragments exert on various parts of the skin which would not naturally form a lens a specific effect, like that of a ferment, which induces multiple lens-formation.

Sex Determination.—Without encroaching on the article SEX, we may notice the general fact that the inquiry has become wholesomely experimental along several distinct lines. (a) The striking work of Geoffrey Smith and Potts, following Giard's pioneer observations, has shown that the castration of a male crab by a Rhizocephalan parasite induces an expression of latent feminine and female features. The male put on abdominal limbs like those of a female, and the gonad showed ova; and Smith's theory, stated briefly, was that the parasite alters the composition of the male's blood to or toward a female condition, and that this is naturally followed by the development of latent female secondary characters, or by the regeneration of an ovary instead of a testis from the indifferent residue that remains at the end of the infection. Metabolism-stimulation activates latent sex characters. Using the terminology of *The Evolution of Sex* (Geddes and Thomson, 1889), Geoffrey Smith summed up: "This adaptive regulation consists in the production of at least a partially female condition of anabolism as opposed to a wholly male condition, the female condition being preponderantly anabolic or conservative, as opposed to the katabolic male condition, and, by this change from a katabolic to a more anabolic condition, the animal can withstand better the drain on its system increased by the parasite." (b) Many experiments show that latent masculine characters in a female animal, or latent feminine characters in a male, may be activated by changes in the internal secretions of the gonads. (c) Baltzer (1914) has shown that if the very young sexually indifferent larvæ of the worm *Bonellia*, just hatched from the eggs, happen to become attached to the proboscis of an adult female, they develop into males; whereas, if they fail to attach themselves and sink into the sand or mud, they develop slowly (almost exclusively) into females. But the story does not end here. Baltzer helped some of the very young free-swimming *Bonellias* to attach themselves to the proboscis of a full-grown female; those that he left attached for a very short time developed into almost perfect females; those that he left attached for a long time became perfect males, if such degenerate pigmies can be called perfect; while those that he left for intermediate periods showed practically all grades of inter-sex. These fine experiments point to a conception of sex as plastic, reversible, constitutional, and quantitative. (d) The recent work of Oscar Riddle has made it practically certain that pigeons produce two kinds of eggs which differ in the rate or intensity of their chemical processes. One kind of egg has a low storage capacity, a high oxidizing capacity, and a relatively higher intensity of metabolism; and such a type of egg develops into a male bird. The contrasted type of egg develops into a female bird, while an intermediate type of egg, produced for instance early in the season, will develop into a female bird with an admixture of masculine features. Femaleness in an egg is associated with high storage capacity, less intensity of metabolism, lower percentage of water, higher total of fat and phosphorus, and greater energy value in the yolk as determined by the calorimeter. It is of further interest to notice that analyses of the blood of adult cocks and hens show a persistence of constitutional differences analogous to those which mark the two kinds of ova. These experiments furnish a corroboration of the thesis, suggested in 1889 by Geddes and Thomson, that femaleness is associated with a relative preponderance of constructive up-building, or anabolic processes, and conversely for maleness.

It need hardly be said that what seems to have been made very probable for the pigeon need not hold good in the same way for other animals. Thus in frogs it is probable that all the eggs are alike to begin with, but that there are two kinds of spermatozoa, one with and the other without a special sex-chromosome. If the eggs are quite normal at the time of fertilization the determination of the sex depends on whether the egg is fertilized by a sperm with the special sex-chromosome (which results, it is believed, in a female offspring), or by one without the sex-chromosome (which results, it is believed, in a male offspring). Even clearer cases have been worked out in insects by Prof. E. B. Wilson and others. It does not follow that the physiological condition of the ova is of no importance, for over-ripe frog's ova tend to develop into females. Moreover, the presence of the special sex-chromosome may be associated with certain constitutional differences in the germ-cell—an index as much as a cause.

Regenerative Capacity.—Prof. T. H. Morgan's critique (1901) of Weismann's theory of regeneration as an adaptive phenomenon—occurring in those two animals and in those parts of animals which, in the natural conditions of life, are particularly liable to non-fatal injury, has been followed by interesting experiments and observations. It seems that regeneration often follows the experimental excision of a part which could rarely, if ever, be lost in the ordinary conditions of life. In such cases it seems gratuitous to search for some far-fetched evidence of adaptiveness. It seems more reasonable to regard the regrowth of an excised portion of the body as a special exhibition of a power which is always in operation in the repair of certain tissues, such as the glandular epithelium of an intestine. On the other hand, this will not suffice when there is definite prearrangement establishing a weak breaking plane, as in a crab's claw or a lizard's tail. The fine work of Dr. J. H. Paul (1915) has shown in the case of the shore-crab (*a*) the definite prearrangements at the breaking plane; (*b*) the muscular arrangements that secure the rapid surrender of a captured or broken limb; and (*c*) the presence of a two-flapped membrane, pierced by nerve and blood-vessel, which automatically folds over the wound and prevents hæmorrhage. To this has to be added the way in which the new limb is fully formed within the scar before it is jerked out after a moult. When it is known that a breakage of a leg by a dislodged stone is a common accident among shore-crabs, the adaptiveness of the special arrangements seems more than plausible.

Senescence and Rejuvenescence.—The study of development in the widest sense includes the phenomena of senescence as well as those of adolescence, and there is no doubt that progress is marked by such studies as those of C. M. Child (1915). On an experimental basis, mostly in regard to planarian worms, Child rests the conclusion that as an organism differentiates, it ages, for there is a necessary accumulation of relatively inactive and stable constituents in the colloidal cytoplasmic substratum, and this accumulation involves a decrease in the rate of metabolism, as the flow of a stream may be slowed by what it deposits in its bed. There are indeed counteractive processes of reduction, removal, and de-differentiation, when the metabolic stream may be said to erode its bed instead of depositing more materials. Periods or it may be crises (often seasonal) of rejuvenescence alternate with periods of senescence. Sooner or later, however, rejuvenescence lags and senescence prevails. Exceptions, as Weismann and others suggested, are to be found in the Protozoa, where recuperative rejuvenescence is wellnigh so perfect that it implies bodily immortality. The question rises whether a similar evasion of natural death may not occur also in some simple Metazoa such as hydroid polyps and planarian worms.

In the same connexion may be noticed the observations of L. L. Woodruff on pure-line (all descended from one individual) cultures of the slipper-animalcule *Paramoecium*, which multiplies by fission. In 1915 he reported on a stock which had been living for over eight years, 5,250 or more asexual generations. There had been no conjugation (which does not occur in members of a pure line) and no artificial stimulus or secret of continued vitality, so different from the

aging observed by Maupas, being abundant food and a thorough removal of waste products from the water. Very suggestive is the periodic, approximately monthly, occurrence of *endomixis* observed by Woodruff and Erdmann (1914), a disruption and reorganization of the nuclear apparatus, similar to that which precedes conjugation in natural conditions. It appears to serve as a process of rejuvenescence, and it serves, perhaps, like conjugation, to provoke variability.

Another correlated idea, to which the work of some palæontologists has pointed, is that one type of animal may differ from another in the relative length of the chapters in the life-history. The pre-natal chapter may be long in one, e.g. elephant, and very short in another, e.g. opossum; the larval period, long drawn out in a crab, is telescoped down in the crayfish. The young storm-petrel remains many weeks in the burrow; the young mound-bird may run or fly from its birthplace on the day it is hatched. A queen-ant or a queen-bee may live for several years as an adult, while the may-fly sometimes completes its adult life in an evening. The idea is that an arc in the curve of life may be shortened or lengthened in related types, as the adaptive outcome of "temporal" variations. In vertebrate animals it is known that changes in the activity of the glands of internal secretion may hasten or slow down processes of development as well as processes of metabolism.

(D) AETIOLOGICAL EVOLUTIONARY ZOOLOGY

Heredity.—Prof. T. H. Morgan (1915, p. 7) calls attention to a curious situation which has begun to develop since 1900, when Mendel's law was rediscovered. "The students of heredity, calling themselves geneticists, have begun to draw away from the traditional fields of zoölogy and botany, and have concentrated their attention on the study of Mendel's principles and their later developments. The results of these investigators appear largely in special journals. Their terminology is often regarded by other zoölogists as something barbarous—outside the ordinary routine of their profession. The tendency is to regard genetics as a subject for specialists instead of an all-important theme of zoölogy and botany." It is to be hoped that this severance is only a passing phase, for its accentuation would mean much loss on both sides. "It would be as unfortunate for all biologists to remain ignorant of the modern advances in the study of heredity as it would be for geneticists to remain unconcerned as to the value for their own work of many special fields of biological inquiry." Of clear exposition by investigators like Bateson and Punnett, Castle and Morgan, there is no lack, and the advantages of a synoptic view of the fundamentals of zoölogy as a whole do not need to be enforced by argument.

Referring for due treatment to the article MENDELISM, we may call attention here to three points of general interest. (*a*) In two recently published books we find two extraordinarily discrepant statements in regard to heredity. In one of them Prof. J. P. Lotsy (1916, p. 63) says: "We know absolutely nothing of heredity." In the other Prof. T. H. Morgan (1919, p. 15) speaks of the fundamental aspects of heredity having turned out "so extraordinarily simple," and he elsewhere indicates that the problem of heredity may be regarded as solved. What is the meaning of this startling divergence of statement? The first author had in mind the difficulty of conceiving how all the manifoldness of a well-endowed organism is telescoped down into a microscopic implicit individuality—the germ-cell. The second author was contemplating the precise way in which certain characters of the parents, carried by the chromosomes, are distributed among their offspring. For a large number of cases the modern theory of factors or "genes," located in linear order in the chromosomes, is convincing and clear. (*b*) The list of characters proved to exhibit Mendelian inheritance is always increasing. Many organisms consist, in part at least, of a great bundle of "unit-characters," the factors for which behave in inheritance as if they were indivisible entities. They do not blend or intergrade; they are present in a certain proportion of the progeny; they are normally either there in their entirety or completely absent. It is now recognized, indeed, that one

factor or gene may have manifold effects and that one character may be the product of many genes, yet the general idea remains that "the germ-plasm is made up of units that are independent of each other in at least two respects, namely, in that each one may change (mutate) without the others changing, and in segregation and in crossing over each pair is separable from the others" (Morgan, 1919, p. 240). The balance of present opinion seems to be strongly in favour of interpreting all inheritance as Mendelian, but it seems to many not unscientific to say that there is another mode of inheritance which may be described as "blending." There are indeed ways of explaining away blending as due to the coöperation of multiple Mendelian factors, and we are also now being introduced to "Mendelian characters which slowly blend"; but in an article which attempts a general survey it seems just to cite the considered opinion of an experimenter and thinker like Prof. W. E. Castle (1916, p. 218), who writes: "It seems best, accordingly, to attempt neither with Galton to generalize all inheritance as blending nor with Johanssen to treat all inheritance as alternative, but frankly to recognize the existence of two categories of cases distinct in their inheritance behaviour."

Inbreeding and Outbreeding.—Attention has often been directed to the evolutionary importance of inbreeding and outbreeding (exogamy and endogamy), but it is only within recent years that firm foundations have been laid (see East and Jones, 1920). Professional breeders have recognized for a long time that close inbreeding, accompanied by the usual judicious selection and elimination, fixes desirable characters and leads toward a uniform and stable herd; and yet that it has disadvantages, being apt to lead to reduction in vigour, resisting power, fecundity, and even size. Till recently there has been no secure answer to the important question, whether the disadvantageous consequences are actually induced by the close breeding as such, or are simply brought to light and accentuated by it. Experiment has furnished the answer. It has been proved that the close inbreeding of fine stock, associated with the usual selection and elimination, may be persisted in for several generations without any undesirable consequences. Many fine breeds of animals have had very close inbreeding at their beginning; and there seems to be habitual endogamy among bees and ants. In certain forms of "isolation" there is bound to be close inbreeding. Furthermore, it has been shown that the direct result of persistent inbreeding is to segregate within the stock a number of true breeding strains of similar individuals. If there were, at a given time, in a herd, say, four distinct hereditary factors relative to a particular character, such as the colour of the peltage, then if the factors illustrated Mendelian inheritance, the automatic effect of inbreeding would be to segregate four types, pure as regards the particular character in question. But some of the characters which thus become isolated may be undesirable "recessives," seldom seen under ordinary circumstances because they are hidden by their "dominant" counteractives. Thus the undesirable character of albinism, likely to be kept out of expression in conditions of exogamy, is isolated and brought to light in endogamy. These exposed recessives have given inbreeding its bad reputation, but now that the occurrence is understood the elimination of these recessives by the practical breeder becomes a more hopeful task. When the same undesirable qualities occur on both sides of the house, inbreeding tends to their diffusion and exaggeration, yet the result of modern experimenting is clear: "Inbreeding is not in itself harmful; whatever effect it may have is due wholly to the inheritance received" (East and Jones, 1920). But there is another phenomenon, namely the increased "vigour" which often rewards outbreeding. Darwin was strongly of opinion that the gain in constitutional vigour derived from an occasional crossing was a more important biological fact than the loss that often followed close inbreeding, and modern experimenters have confirmed his shrewd judgment. The outbreeding often has advantageous results like those that reward a notable improvement in nurture. There may be an increase in "vigour," resisting power, size, and other good qualities. The reason for this frequently observed

"hybrid vigour" is probably to be found in the pooling of diverse hereditary resources of good quality, not in some vague physiological stimulus to the offspring. The general aspects of this kind of inquiry are very important. Thus one of the great trends of organic evolution has been toward the securing of cross-fertilization, though the range of crossing in different cases varies within wide limits. The survival value of this cross-fertilization probably lies in the fact that it promotes variability. It brings about a greater variety of raw material on which selective agencies can work. Similarly, for the wider ranges of cross-fertilization which we call outbreeding, the suggestion arises that this is fundamentally valuable in promoting variability, both in the way of new patterns and fresh vigour. A new light is shed on the process of evolution if we consider the probability that success has rewarded the alternation of periods of exogamy with periods of endogamy. Thus there is a return to the position of Romanes, Gulick, and others, that "isolation" may count for much in evolution. Another ray of light, and a very welcome one, touches the dark problem of sterility. It is suggested by East and Jones that there are two quite different kinds of sterility of diverse origin: (1) Inbreeding tends to sort out homogeneous pure strains and in this sifting out the ability to reproduce may be lost; (2) outbreeding may bring together two germ-cells which are too incompatible, e.g. in their chromosomal equipment, to allow of a continuance of the process of germ-cell making. Thus, the number of chromosomes in the two parents (e.g. horse and ass) may be too discrepant.

Nature or Nurture.—There is a mounting up of evidence as to the influence of environment and function on the developing organism. Just as a certain quantity of food, oxygen, and moisture is essential if the inheritance is to be expressed, so is it with the wider environment of liberating stimuli, and so it is with functioning and exercise. Up to a certain point the chick's lung develops in virtue of the properties resident in the germinal material; beyond that point the development requires that the chick shall breathe. If the word "nurture," which Sir Francis Galton made technical, be used to include all manner of nutritional, environmental, and functional influences, it may be fairly said that modern zoölogy has been marked by an increasing appreciation of the importance of "nurture," as complementary, not antithetic, to the hereditary "nature." As Prof. T. H. Morgan says (1915): "every character is the realized result of the reaction of hereditary factors with each other and with their environment"; and again: "it is a commonplace that the environment is essential to the development of any trait, and that traits may differ according to the environment in which they develop." Gudernatsch has shown that in tadpoles fed on thyroid there is differentiation without growth, while in tadpoles fed on thymus and spleen there is growth without differentiation. Fruit-flies (*Drosophila*) with a peculiar Mendelian abnormality may appear perfectly normal if reared in a dry bottle, but the presence within them of the "factor" for the abnormal character may be demonstrated by rearing their offspring in a damp bottle (Morgan, 1915). Loeb has shown that it is easy to produce a percentage of minnow (*Fundulus*) embryos with defective eyes by adding a very minute quantity of potassium cyanide to the water, or by exposing the developing eggs to low temperature. That is to say, relatively slight environmental changes may so alter the constitution of the developing embryo that a leap is taken in the direction of blindness. Peculiarities in natures may enhance or depreciate the hereditary virtues of the organisms; they may induce a modification which serves as a life-saving screen until an innate variation in the same direction has time to establish itself; in cases like mammals and seed-plants the nurtural condition of the maternal parent may influence the vigour of the offspring during the ante-natal symbiosis; changes in nurture, as Tower's experiments (1906, 1918) suggest, may be variational stimuli to the germ-cells.

In regard to the prolonged discussion over the transmissibility of exogenous somatic modifications, the chief need is still for more facts. It is admitted that somatic modifications may have secondary effects on the germ-cells and on the offspring

(especially in the case of the viviparous mammals), but this is not the same as the transmission of particular modifications as such or in any representative degree. It is probable, as Agar's experiments (1913) suggest, that long-continued, deeply saturating environmental and functional peculiarities may produce specific substances which enter into the cytoplasm of the germ-cell, or into the embryonic body, and may exert a very definite influence as long as they last; but there is as yet no convincing evidence that the resulting changes grip the constitution permanently. J. T. Cunningham (1908) and others have suggested that particular modifications of an incisive sort may liberate very specific chemical substances, like hormones, and that these may be carried to the germ-cells and accumulate there with subsequent formative (morphogenic) effects. The number of competent zoölogists who hold to some form of Lamarckism should be enough to restrain the impatient from attempting to close this important question or to dogmatize about it. As Prof. E. B. Wilson has wisely said: "In the present defective state of our knowledge we may well grant that there may be many a thing between germ-cell and body that is not yet dreamed of in our biological philosophy." It should be clearly understood that there is no depreciation of the varied importance of peculiarities in nurture on the part of those who are unable to find convincing evidence of the transmission of any exogenous somatic modification. It is incorrect to say that this scepticism leads to the view that individual experience counts for nothing racially. On the contrary, it is through individual experience that germinal variations or mutations are tried and tested.

Evolution Theory.—It would be a contradiction in terms if the Evolution Theory did not evolve. What changes are in process? (1) Some methodological progress has been made in clarifying the concept of organic evolution (see Sorley, 1909). "Organic evolution is a continuous natural process of racial change in a definite direction, whereby distinctively new individualities arise, take root, and flourish alongside of, or in place of, the originative stock" (Thomson, 1920, p. 378). We must also clearly distinguish this from (a) the "genesis" of a solar system or of a mountain or valley; (b) the "development" of an organism as an individual; and (c) the "history" of a human society. (2) Somewhat startling is the suggestion made by Bateson (1914), that we should consider "whether the course of evolution can at all reasonably be represented as an unpacking of an original complex, which contained within itself the whole range of diversity which living things present." "At first it may seem rank absurdity to suppose that the primordial form or forms of protoplasm could have contained complexity enough to produce the divers types of life. But is it easier to imagine that these powers could have been conveyed by extrinsic additions?" In so far as this view means that there is nothing evolved which was not originally in kind involved, that there is nothing of lasting value in the end which was not represented in kind in the beginning, it may be philosophically tenable; but most biologists will probably adhere to the view that organic evolution has been a process of racial epigenesis (not an *evolutio*), with a frequent outcrop of genuine novelties, a synthetic complexifying by creative inventions and by trading with time, rather than an analytic simplification through the removal of inhibitions which allowed the original richness of endowment to express itself with increasing fullness. There was a time when there were no birds or mammals; they came into being, and they were new ideas; they made a new world. (3) While there is practical unanimity among the zoölogists of to-day as to fact of organic evolution, there is a clearer apprehension than there was a generation ago of the detailed difficulties. These difficulties are chiefly of three kinds: (a) that little is known with certainty in regard to the pedigree of the great phyla, such as Vertebrates, and as to the way in which the biggest steps were taken, like the passage from Protozoa to Metazoa; (b) that there naturally remains much uncertainty in regard to the factors operative in the historic process, and as to the conditions implied in the hereditary or genetic relation between one generation and another; and (c) that in regard to the originative factor termed for convenience "vari-

ability," our ignorance is still immense. Bateson expressed the mood of many when he said (1913, preface): "That species have come into existence by an evolutionary process no one seriously doubts; but few who are familiar with the facts that genetic research has revealed are now inclined to speculate as to the manner by which the process has been accomplished. Our knowledge of the nature and properties of living things is far too meagre to justify any such attempts." And later in the same work (p. 97), he says: "We have not even an inkling of the steps by which a Silver Wyandotte fowl descended from *Gallus bankiva*, and we can scarcely even believe that it did." (4) It is pessimistic to say that we are no nearer an understanding of the central problem of aetiology, namely the origin of the new, i.e. of the variations or mutations which form the raw material of progress or the reverse. The ground has been cleared, though the problem remains unsolved. (a) If from the observed differences between the members of the same species there can be subtracted all the peculiarities that are associated with age and sex, and likewise all that can be reasonably interpreted as individually acquired exogenous somatic modifications (directly due to peculiarities of nurture, whether environmental, nutritional, or functional), then we get at the true variations and mutations—inborn, not acquired—endogenous, not exogenous—blastogenic, not somatogenic—expressions or outcomes, not indents or imprints. If there be no convincing evidence of the transmission of extrinsic modifications, as such, or in any representative degree, then they cannot be included, in the first instance at least, among the raw materials for evolution, which are thus confined to what is left when the modifications are subtracted from the total of observed differences. That some at least of this residue, as true variations, are very transmissible, is quite certain. This is the first clearing of the ground. (b) But within the large category of inborn changes it seems possible to distinguish minute continuous variations from brusque saltations (Darwin's "sports," Galton's "transilient variations," Bateson's "discontinuous variations," and of course the "mutations" of De Vries; all these being practically the same, though investigated with ever-increasing care). The minute continuous variations, on the other hand, are of the nature of "a little more or a little less," and they show intergrades. Their transmissibility has not been much studied, but has been proved in a few cases. The mutations, whether large or small, are more deserving of the title qualitative; they often show a measure of perfectness from their first appearance, they are without intergrades, they are markedly transmissible, and they are demonstrably at the origin of some new varieties of domesticated animals and cultivated plants. They correspond to, or are implicated in, those "unit characters" of species or varieties which illustrate Mendelian inheritance in their recurrence from generation to generation. Now whether we attend to the continuous or to the discontinuous variations, we can imagine them to arise in the course of the shufflings of the hereditary cards (the chromosomes and their microsomes) during the intricate processes of maturation and fertilization. The reduction or exaggeration of a quality, the dropping out of a character altogether, a "double dose" of a character, a rearranged pattern of hereditary items, may all be interpreted as due to permutations or combinations of hereditary factors or genes during the intricate manoeuvres preceding the completion of the fertilization of the ovum. The evidence is very strong that the segregation of the factors of Mendelian characters takes place in the reduction divisions of the germ-cells in the process of maturation. An interesting corroboration has been furnished by the recent experiments of Prof. W. E. Agar (1920) with a parthenogenetic "clone" (pure line) of a hybrid water-flea (*Daphnia pulex* × *Daphnia pulex*). No reduction divisions occur in a parthenogenetic lineage, and no Mendelian variations occurred. Along with the rearrangements which may be effected in the maturation of the germ-cells—rearrangements in which such phenomena of chromosomal behaviour as "crossing-over" must be taken account of—another possibility of change is afforded at the beginning of each individual life; for there, in all

ordinary cases, two very complex systems, of dual origin, become a new unity which normally develops into a harmonious organism. Some modern evolutionists, such as Lotsy (1916), attach great importance to crossing as a cause of variations.

If it be said that such opportunities as have been mentioned could account for nothing more than rearrangements, pluses and minuses, gains and losses, but not for any distinctively novel change, the difficulty of interpretation increases. But even among Mendelians it is sometimes admitted that the factors or genes may themselves change. How this might happen is at present the subject of speculation, but this need not be unreasonable, and it is sometimes backed by the beginning of experiment. Three suggestions may be stated. First, it may be, as Weismann believed, that deeply saturating environmental influences act through the body as variational stimuli on the germ-cells, provoking them to change. It is known that changes in a cell's environment may cause disturbance of the process of cell-division, and this, as Bateson has pointed out, may be the *fons et origo* of germinal variation. Apart from demonstrable external stimuli, it is possible that the chromosomes of the germ-cells may change suddenly like mutating Bacteria, or may undergo age changes, or may exhibit periodic reorganizations, like the remarkable endomixis that occurs about once a month in a "pure line" of *Paramoecium*, or may show rejuvenescence-changes, like those which occur in some cases of regeneration and asexual multiplication. It must be borne in mind that the chromosomes are very complex living bodies, and that differences between species are sometimes the expressions of visible differences in the chromosomes, as Gates (1915) has shown in the case of *Oenothera*.

The Mendelian conception of unit-characters, whose germinal factors or genes behave like discrete unities in inheritance, neither blending nor fragmenting, has had to be corrected by fuller knowledge. Thus Prof. T. H. Morgan (1919) lays emphasis on the conclusions: first, that each gene may have manifold effects on the organism; and second, that every part of the body, and even each particular character, is the product of many genes. The phenomenon of linkage also shows that chains of genes may keep together in inheritance instead of there being free assortment of the various links in the chain. Thus from the idea of extreme particularity which Mendelism at first suggested, there is a return toward the Darwinian idea, on which Sir E. Ray Lankester, especially, has laid emphasis, of the correlation of variations. Several apparently independent changes may be diverse outcrops due to one disturbance. A change in some particular kind of metabolism may reverberate through the whole body. Another idea of considerable importance is that of temporal variations, that is to say, alterations in the "time" or rate or rhythm of certain metabolic processes, or in the duration of particular phases in the life-cycle. Many changes of great adaptiveness are interpretable as lengthenings out or shortenings down of particular chapters in the life-history. In the influence of internal secretions in backboneed animals there is a known method whereby these variations in tempo might be brought about; and it is worthy of notice that in Sebright poultry, where the cocks are hen-feathered, an endocrine secretion depends on a genetic factor inherited in the same way as are other genetic factors (see T. H. Morgan, 1919, p. 243).

Many palaeontologists, with remarkable concurrence, have reached the conclusion that an evolving line often changes not by discontinuous steps (saltations or abrupt mutations), but by continuous minute steps. This is well illustrated by Dr. Rowe's study of the species of the sea-urchin *Micraster* in the chalk of S.E. England and just as well by the evolution of Mammalian teeth. Speaking of Tertiary mammals, Dr. W. D. Matthew writes (1910): "The more complete the series of specimens, the more perfect the record in successive strata, and the nearer the hypothetical centre of dispersal, the closer do we come to a phyletic series whose intergrading stages are well within the limits of observed variation of the race."

Whether the individual changes in the past were continuous and minute transitions, like those which Dr. Duerden finds occur-

ring to-day in the ostrich, or were discontinuous and minute saltations, or both, no one can tell; and the question does not seem very important. Even in ordinary growth what seems by one mode of measurement continuous, may be shown by another and finer method to progress rhythmically, even to seeming fits and starts. But the palaeontologist tells us more; he can arrange his species in series in a time-succession. "There is not merely transition, but transition in orderly sequence, such as can be represented by a graphic curve of simple form" (Bather, 1920, p. 73). Moreover, in this seriation there may be gradual increase or decrease as in the number of spines or tubercles, or in the size of horns or digits; and this gives the palaeontologist an advantage over the neontologist, inasmuch as he can point to progression or retrogression extending throughout millenia. It is for the neontologist to assist the palaeontologist by pointing to determinate variation occurring in generations of living animals; for it may have been by such mode of variability that the seriations of the rock record were produced (see Bather, 1920, p. 74).

There is a growing body of evidence in support of the view that variation is often a very definite kind of organic change. This cannot be assured from the movement of a species as such; for the inferred orthogenesis might be the outcome of selection, sifting out those best adapted to a particular environment which might also be changing in a definite direction, say of increased salinity or aridity. But when large numbers of specimens are procurable, and can be studied in successive years (or centuries in strata), the non-occurrence of variations off the line is significant. If this be so, it is not necessary to look for any particular impulse from within to account for the definiteness. It may be enough to recognize that the unified organization, stereochemical in part at least, must to a certain extent predetermine what variations (other than pathological disintegrations) emerge.

Here may also be mentioned the suggestion of dichotomous variation, as between types of passive and active (anabolic and katabolic) preponderance, and as resulting in contrasts of allied forms, like bee and wasp, moth and butterfly, sheep and goat, and to larger differences as of reptile and bird, even of plant and animal, female and male. (See P. Geddes, *Variation*, E.B., 9th ed.; and Geddes and Thomson, *Evolution*, 1911.)

Natural Selection.—The zoologist of to-day has to face the reconciliation of two sets of facts as regards natural selection. In a few cases, such as Weldon's crabs, it has been demonstrated in actual effective operation, and Cessola's test of the protectiveness of colouring by tethering green mantises with silk threads on brown herbage and brown variants on green herbage, gave vividly convincing results. Working with "hooded rats," Prof. W. E. Castle selected simultaneously in two opposite directions; and produced one race black all over except for a white patch of variable size underneath, and another race white all over except for the top of the head and the back of the neck, which are black. On the other hand, it has been shown by Johannsen, de Vries, Jennings, Pearl and others that selection does not count for much within pure lines or inbred stocks. Within an inbred race of guinea-pigs, for instance, a *ne plus ultra* may be reached, beyond which no amount of selection is of any avail within the period of experimentation. Abundant "fluctuations" of a quantitative sort occur, but these cannot be used as a basis for selection since they are not transmissible. They are probably for the most part of the nature of somatic modifications.

The estimate of the scope of natural selection is plainly affected by the view taken in regard to the raw materials supplied. If a new position of structural or functional equilibrium is reached by mutational abruptness, there is no need in such a case to burden natural selection with the task of gradually accumulating minutiae. On the other hand, due attention should be given to de Vries's declaration (1909, p. 83): "Thus we see that the theory of the origin of species by means of natural selection is quite independent of the question, how the variations to be selected arise? They may arise slowly, from simple fluctuations, or suddenly, by mutations; in both cases natural selection will take hold of them, will multiply them if they are beneficial,

and in the course of time accumulate them, so as to produce that great diversity of organic life, which we so highly admire." In the same way, if variations are in large measure definite, natural selection has not to sift out the serviceable from a large casual crop, but it still has its work to do.

The trend of recent zoölogy seems to be toward a confirmation of the central idea in Darwinism—the selection of the relatively fitter variants in the struggle for existence. Thus there is no longer serious difficulty in meeting the criticism that slight initial variations could not have survival value, or that they would be swamped by intercrossing. There is also a deeper appreciation of the fact, on which Darwin so often laid emphasis, that selection is a manifold and often subtle process of sifting. Thus lethal selection must be distinguished from reproductive selection, and the operation of selective processes at many levels, even among germ-cells, must be recognized. The ubiquitous sifting is anything but automatic, since animals often select their environments, instead of being selected by them, and may be in various ways active agents in their own evolution. Natural selection operates in reference to an intricate web of life, and thus a nuance—a shibboleth—may have survival value. There has been an evolution of the sieves as well as of the sifted, for natural selection operates, generally speaking, in relation to an ecological *Systema Naturae*—or system of interrelations—which has been increasingly elaborated through the ages; and this (along with what may be called organismal momentum) is probably part of the explanation of the general progressiveness of organic evolution.

Sexual Selection.—No part of Darwin's theory has met with a more critical reception than his theory of sexual selection; and yet it often has weathered the storm. (a) When there is forceful competition among rival males there is some evidence that the less well equipped with weapons will have fewer and less vigorous offspring, or it may be, none at all. This will operate like ordinary natural selection. (b) The same may be said of those masculine characters which aid males to find, pursue, and catch the female. (c) Sexual selection meant, for Darwin, all the processes of sifting that occur in connexion with mating and pairing, whether the female held the sieve or not; but he firmly believed that in a certain number of cases there is definite preferential mating on the female's part, the more attractive males having a reproductive advantage. While Prof. T. H. Morgan has given, in his *Evolution and Adaptation* (1903), no fewer than 24 reasons for rejecting the theory of sexual selection, many zoölogists believe that the reality of some measure of preferential mating has been placed beyond doubt by the data furnished by Darwin himself (1871) and by the Peckhams (1889), Groos (1898), Cunningham (1900), Pycraft (1913), Julian Huxley (1914), Whitman (1919) and others. It is not necessary to suppose that the female chooses "the best of the bunch" from amongst her unequally endowed suitors; it will be enough if she remains unresponsive to the solicitations of certain of the less generously endowed, who do not arouse her emotional interest to the requisite pitch. This is in agreement with Darwin's own remark about the female bird: "it is not probable that she consciously deliberates: but she is most excited or attracted by the most beautiful, or melodious, or gallant males." It is not necessary to credit the female with a capacity for appreciating slight differences in decorativeness or musical talent or litheness, or with a consistency in allowing these nuances to determine her preferential mating, season after season, generation after generation. It is enough, as Lloyd Morgan says, that "the hen selects the mate which by his song or otherwise excites in greatest degree the mating impulse. Stripped of all its unnecessary æsthetic surplusage, the hypothesis of sexual selection suggests that the accepted mate is the one that most strongly evokes the pairing instinct." But this does not mean that the details do not count; it is rather that each is contributory to a general impression. Each has its effect; but synthetically, not analytically. "Even when the female seems to choose some slight improvement in colour or song or dance, the probability is that she is simply surrendering herself to the male whose *ensemble*

has most successfully excited her sexual interest" (Geddes and Thomson, *Evolution*, 1911, p. 172).

It is interesting to inquire into the racial justification of the courtship habits—often so prolonged, elaborate, and exhausting. According to Groos (1898, p. 242) the coyness of the female, which has to be overcome, is an advantageous check to the impetuous violence of the sex impulse. According to Julian Huxley the elaborate ritual of the Great Crested Grebe serves to forge an emotional bond. "The courtship ceremonies serve to keep the two birds of a pair together, and to keep them constant to one another." Pycraft (1913) also insists on the need for psychological interpretation. Karl Pearson suggests that pronounced and persistent preferential mating within a species being differentiated into types may lead to a physiological and psychological "isolation" (i.e. narrowing of the range of intercrossing), and thus to "the relative or absolute mutual sterility of the differentiated types, i.e. to the origin of species" (*Grammar of Science*, 2nd ed. 1900, p. 418). Finally, it may be noted that the courtship habits must have played an important part in the evolution of sense (e.g. the æsthetic sense), and even of mind. This has been well illustrated by S. J. Holmes (1916) in connexion with the evolution of the voice, which began as a sex-call in amphibians, but gradually broadened out as parental summons, infantile cry, and kin-signal, until it became the means of reasoned discourse. That after the last returns the first is obvious in every serenade.

Naturalist Travellers.—From Darwin's *Voyage of the "Beagle"* (1844) and Wallace's "*Travels on the Amazon*" there has been a fine succession of the tales of naturalist travellers. This has been sustained in the last 20 years, and with increasing specialization. In the older narratives there is naturally much that is not definitely zoölogical; in many of the newer the zoölogical or biological note is dominant. We may instance such books as Alcock's *Naturalist in the Indian Ocean*, Hickson's *Naturalist in the Celebes*, Hudson's *Naturalist in La Plata*, Saville-Kent's *Naturalist in Australia*, Semon's *In the Australian Bush*, and Siedlecki's *Java*.

Faunal Evolution.—A line of zoölogical research which has had some fine expressions in recent years is that of constructive faunistic interpretation, following the lead of Wallace in his *Island Life* (1880). One of the best examples is Dr. James Ritchie's *Influence of Man on the Animal Life of Scotland* (1920). Neolithic man penetrated into a country which, after the clean sweep of the Great Ice Age, had been restocked with animal life from the south of England and from the Continent. There were then no domesticated animals, nor aliens like rabbits and rats. But there were elk and reindeer, wild cattle, wild boar, perhaps wild horses—a fauna of large animals on which lynx, brown bear, and wolves levied toll. This post-glacial fauna was the capital with which prehistoric man started, to which he added various imports from abroad, and which at times he likewise taxed heavily. With fine zoölogical scholarship Ritchie traces the changes brought about by domestication, by the destruction of beasts and birds of prey, by deliberate protection in various interests, by the intentional and unintentional introduction of new animals from other countries, and by the cutting down of forests, the spread of cultivation, and other human interferences. While more species have been introduced into Britain than have been exterminated (the fauna having substantially gained in numerical strength), there has been a falling off in what may be called faunistic quality. For many masterly creatures have been replaced by elusive vagrants, and giants by pigmies. "We have, in effect, lost more than we have gained; for how can the increase of rabbits and sparrows and earthworms and caterpillars, and the addition of millions of rats and cockroaches and crickets and bugs, ever take the place of those fine creatures round the memories of which the glamour of Scotland's past still plays—the reindeer and the elk, the wolf, the brown bear, the lynx, and the beaver, the bustard, the crane, the bumbling bittern, and many another, lost or disappearing?" (p. 497). We have singled out this book as an outstanding instance of a kind of zoölogical investigation which is inter-

pretative as well as observational, synthetic and constructive as well as analytic. In its vivid realization of the correlation of organisms, this "study in faunal evolution" continues the tradition of Darwin.

Mechanism and Vitalism.—Coming finally to the "*Magnalia Naturae*," and the diverse attitudes of modern zoologists to these, as in the long controversy of mechanists and vitalists, we cannot yet say that substantial conclusions have been reached. The conflicts between mechanistic and vitalistic interpretations, between the purely physiological (*i.e.* apsyhic) and the psychological descriptions of behaviour continue with undiminished vigour. Yet there is progress in the fact that the questions at issue are being defined with increasing precision. (a) Everyone allows that there is a chemistry and a physics of the organism; that a chemical and physical (*i.e.* theoretically mechanical) description can be given of much that goes on in the living body; that the chemical and physical analysis of the animal has yielded very important results; and that this kind of description will certainly extend its scope. (b) It is widely though not unanimously held that there is little help in the hypothesis that a special form of energy ("vital" or "biotic") comes into operation in organisms, and is convertible into equivalent quantities of other forms of energy. For no one has demonstrated this specific vital energy, much less measured its intensity. As the tendency of science is to greater simplification of the forms of energy, we must agree with Bayliss (1915, p. 31) that "it seems somewhat retrograde to assume a new form of energy, especially as there is no urgent necessity for it. The resources of the known forms of energy are not altogether exhausted." (c) Many physiologists occupy the position of Claude Bernard: "There is in reality only one general physics, only one chemistry, and only one mechanics, in which all the phenomenal manifestations of nature are included, both those of living bodies and those of inanimate ones. In a word, all the phenomena which make their appearance in a living being obey the same laws as those outside of it" (*La Science Experimentale*, 1878, p. 116). (d) There is, however, a growing body who hold to what may be called methodological vitalism. Without presuming to set limits to the extent to which chemical and physical descriptions may be given of what occurs in a living animal, and without assuming that the concepts of physics and chemistry are stationary (which they certainly are not), it is urged that up to the present the chemico-physical interpretation remains inadequate. For there has not been given any exhaustive physico-chemical description of any total vital operation, such as the contraction of a muscle, still less of any complex case of animal behaviour. And as to individual development we cannot give a mechanical description of the condensation of the inheritance into a germ-cell, nor of the differentiation of the embryo, nor of the regulation phenomena observed when an embryo rights itself after the building materials of its living edifice have been seriously disarranged, nor of the way in which many developing parts seem to conspire toward one result. Similarly as regards organic evolution: we cannot offer a mechanical theory of variability; and the process of selection is much more than mechanical sifting. In short, mechanical formulæ do not fully suffice for answering biological questions. Biology requires categories of its own. (e) But when the critic of mechanism advances beyond this, to postulate some further vital agency associated with the organism, operating actively in certain cases, directing the chemico-physical processes so that their results are different from what they would have been apart from its intervention, he has passed to thoroughgoing vitalism. Bergson's "*élan vital*" has much of this character; but the most consistently thought out expression of this doctrine is Driesch's "*Entelechy*" (*The Science and Philosophy of the Organism*, 2 vols. 1908). Discussions of the problem of vitalism may be conveniently found in Johnstone's *Philosophy of Biology* (1914), and Thomson's *System of Animal Nature* (2 vols. 1920). See also J. S. Haldane (*Organism and Environment*, 1917) in which he discusses the physiology of respiration as a test case, and with suggestiveness for both sides of the controversy.

ZUIDER (or ZUYDER) ZEE (see 28.1049).—It was after the draining of several landlocked seas and small sea-arms of the province of North Holland had been successfully completed in the early part of the 17th century that, about the middle of the next century, the idea of the shutting off and draining the entire Zuider Zee first began to be discussed. Serious objections to the initial scheme led to various proposals for the draining of parts of that sea, and eventually to a thorough investigation as to the best means of closing and draining it. This

investigation, instituted by the Zuider Zee Society in 1886, gave rise to a scheme put forward in 1891, the execution of which, in a modified form, was begun in 1920.

The requisite bill was introduced in 1913 and was passed almost unanimously by both Chambers of the States-General in 1918. There may perhaps be some cause for wonder that a decision of such import should have been made during war-time. The explanation is that it was just the circumstances of those days, with the shortage of food occasioned by them, which brought into prominence the importance of extending the area of arable land. Moreover, people had still fresh in their memories the severe storm of 1916, which, bursting the Zuider Zee dykes, deluged vast districts of the country.

FIG. 1.

The main features of the scheme are indicated in fig. 1. They consist of (A) the closure and (B) the drainage. The closure is likewise divisible into two parts, namely, from North Holland to the Isle of Wieringen and from that island to Friesland. The combined length of the enclosing dams or barrages is nearly 19 miles. With the completion of the dams 850,000 ac. of the Zuider Zee will be shut off from the North Sea, thus creating a large lake. The dams will afford full protection to the coasts of the provinces bordering on the Zuider Zee for a distance of 152 miles. In the dam sluices

will be required to carry off the surplus of water from the enclosed Zuider Zee, and the quantity may at times be very great, since it will include the afflux of the Yssel, an arm of the Rhine. It is therefore deemed necessary to have no fewer than 30 sluices, 33 ft. wide and 13.2 ft. deep. As soon as the closure is complete various parts of the Zuider Zee can be successively dammed and drained. Four inner enclosures (B) are contemplated, corresponding to the character of the sea-bottom and other factors.

After deducting the dimensions of dykes, canals, and roads the enclosures will provide 500,000 ac. of land, an area equivalent to that of the cultivated districts of North Holland or of Groningen with a surface analogous in composition to the best clay soil to be found in the country. The remainder of the Zuider Zee bottom consists chiefly of sand, and will, consequently, not be reclaimed. The water covering this area is shown in the sketch under the name of Ysselmeer. Its size is about 580 sq. m., which is thrice that of the lakes of Geneva or of Constance. It will constitute a receptacle for the waters of the Yssel and some smaller rivers, and will discharge them through the sluices into the open sea during ebb tide. As a reservoir of fresh water this Ysselmeer will be able to supply the canals of the surrounding provinces in periods of drought.

The Zuider Zee project has thus a double purpose: in the first place the reclamation from the sea of new fertile provinces; secondly, the security from the encroachments of the sea and the supply of fresh water to the neighbouring provinces. In the initial stages of the work heavy clay was dredged out of the open sea and deposited along the track to be followed by the dam. The cost of the undertaking was calculated in 1914 at about £19,000,000, but it seemed likely in 1921 to be very much more. Ten years were allowed for the construction of the main dam and another 20 years for the completion of the four inner enclosures.

See *Flevo*, monthly periodical devoted to the Zuider Zee reclamation scheme; *Maandberichten betreffende de Zuyderzeewerken* (monthly). (C. L.V.)

ZULOAGA, IGNACIO (1870-), Spanish painter (see 28.1049), had become by 1921 the head of a definite school of Basque and Castilian painters, whose work was marked by a realistic and decorative treatment of contemporary Spanish life, consciously based on Velazquez, El Greco and Goya. His art showed increasing emphasis on silhouette, simplification of form and use of broad masses of sombre colour relieved by splashes of more vivid tints. In his figure compositions a low horizon and a panoramic background were favourite devices for obtaining a decorative monumental effect. Women and the nude figure played an important part in Zuloaga's work. In his portraits, of which typical examples are "Lucienne Bréval in *Carmen*," "Cousin Candida," "The Duke of Alba," and "Countess Mathieu de Noailles," emphasis is on the type rather than the individual, and the combination of realism and simplification tends towards caricature. This also appears in his *genre* paintings of Spanish types, peasants, dancers, bull-fighters, priests and beggars, such as "Old Castile," "The Bottleseller" and "The Witches of San Millan." His landscapes, mainly painted round Burgos, Salamanca and Segovia, have a similar bizarre, fantastic quality. His later work includes "My Uncle Daniel and his Family" (1912), "A Cardinal" (1914), "Toreadors" (1914), "Un Versolari" (1916). An important retrospective exhibition of his work was seen at the 1919 International Exhibition at Bilbao, and he was represented by three portraits in the 1920-1 Exhibition of Spanish Paintings at Burlington House.

ENCYCLOPÆDIA BRITANNICA

VOLUME XXXII

THE THIRD OF THE NEW VOLUMES

PACIFIC OCEAN, ISLANDS OF.—For the oceanic islands of the Pacific see generally 20.436*, and also the separate articles on the principal groups and islands there referred to. Supplementary information is given below, and also under GUAM, HAWAII, etc.

The so-called Four-Power Treaty was signed Dec. 13 1921, with prospects of early ratification, by France, Great Britain, Japan and the United States, the contracting parties agreeing "as between themselves to respect their rights in relation to their insular possessions and insular dominions in the region of the Pacific Ocean." A map, showing the mandate claims and sovereignties proposed, and zones of restricted fortification, will be found in the article WASHINGTON CONFERENCE.

America Islands.—Christmas I. was leased by a company from the British Government and planted with coco-nuts in 1904-5, but the working lapsed during the World War, and in Oct. 1919 Lord Jellicoe on H.M.S. "New Zealand" found three men who had been confined there for 18 months, ignorant of the cessation of war. The Pacific "all red" cable station on Fanning I. was wrecked by a German landing party from the "Nürnberg", Sept. 7 1914, but communication was restored by the operator. Fanning and Washington Is. belong to a coco-nut company and had in 1920 populations of a few whites and about 120 and 100 native labourers respectively. These islands are administered under the Gilbert and Ellice Is. Colony, of which Ocean I. is the administrative centre.

Auckland Islands.—A depot of provisions and clothes has been established here by New Zealand for shipwrecked sailors.

Caroline and Pelew Islands.—Japan is mandatory for these formerly German islands,¹ having occupied them in Sept.-Oct. 1914. The administration of Yap, which has a pop. of about 8,000 and a cable and wireless station, was at first in dispute between Japan and the United States; but in Dec. 1921 these countries reached an agreement (a formal convention to be drawn up later for signature) whereby the United States secured the same opportunities as Japan or any other nation in all that relates to cable and wireless service on the island. The pop. of the group was in 1919 about 40,000.

Cook Islands.—These islands, which belong to New Zealand, had a pop. of 8,764 in 1916, including 197 whites and half-castes. Eight Government schools were maintained in 1919. Revenue (year 1918-9) £13,847; expenditure £12,344, but this latter figure excludes certain salaries, etc., and about £7,500 has been contributed annually by New Zealand toward the expenditure. In 1919 exports were valued at £142,925 and imports at £127,729. Copra (to United States) and other fruit (to New Zealand) were chief exports.

Easter Island.—Pop. (1915) about 250, all native except an English manager. The island was visited by Mr. and Mrs. Scoresby Routledge in 1914-5 for the investigation of the ancient remains. These and other recent investigators have shown that the islanders, formerly considered to be of Polynesian race, possess an admixture of Melanesian (negroid) characteristics, and their culture reveals the same influence, notably in the bird-cult with its carved figures, partly human and partly of bird form, and in the practice of distending the ear-lobes. A close association with the bird-cult of Easter I. is found in the Solomon Is., far distant in the western Pacific. It is

suggested that the Melanesian immigrants who carried this cult to Easter I. were followed by Polynesians, who fought but did not exterminate them, and there remain indications of a division of the island between the two stocks. While it is impossible to assign any date for the Melanesian immigration, it has been suggested that the Polynesian took place about the beginning of the 15th century A.D., but the further evidence collected on Easter I. in 1910-20 has not determined to which group of immigrants the megalithic remains are to be attributed, or cleared up the origin of the ideographic script found on tablets in the island.

Fiji.—The pop. of the Fiji Is. was estimated on Dec. 31 1918 at 163,416, including 87,761 Fijians, 2,100 natives of Rotumah, 2,700 natives of various Polynesian islands, 61,745 Indians, 4,748 Europeans, 2,803 half-castes and 913 Chinese. The revenue in 1918 was £371,189, and the expenditure £342,140. Exports in 1919 amounted in value to £1,871,062, of which £882,574 went to New Zealand and £584,067 to the United States of America. About half the exports (by value) consisted of sugar, most of which went to New Zealand. There has been shortage of labour, the importation of Indian contract labour having been stopped in 1916; but arrangements are made to admit free Indian labour. Prices have ruled low in comparison with expenditure and planters have expressed dissatisfaction with the fixation of the price for one year only, by the controlling exporting company. Copra, bananas, molasses and rubber are the other chief exports. Imports were valued in 1919 at £1,060,314, of which £513,547 came from Australia, but the goods thus indicated were in great part re-exports and largely of British origin.

Down to 1916 the education of the natives was wholly under missionary control, save for the Government high school at Nasinu, Suva, and the native high school at Lakeba. But in that year an Education Act rendered all schools complying with certain conditions eligible for Government aid. Suva has a high-power wireless station, and there are four inter-insular stations.

Gilbert and Ellice Islands.—These became a British colony in 1915-6, having been previously a protectorate. Estimated pop. Gilbert I., 30,000; Ellice I., 3,000. Revenue (year 1918-9) £24,450; expenditure £30,734. In the year 1917-8 copra of the value of £63,465 was exported from the colony, and 82,845 tons of phosphates, valued at £83,000, from Ocean I.; but this latter export was expected to reach 200,000 tons in 1920-1. Ocean I. is the headquarters of the Government, and a wireless station was opened there in 1916. The administration includes the America Is. and the Tokelau (Union) Is. between 8° 30' and 11° S. lat. and 171° and 172° W. long. The Tokelau Is., total area 7 sq. m., had a pop. of 912 natives and 2 Europeans in 1911. The Gilbert islanders have lost their warlike reputation, and are all, at least nominally, Christian.

Lord Howe Island, belonging to New South Wales, was placed under a board of control with office at Sydney, as the result of the report of a Royal Commission on the trade of the island in Kentia palm-seeds in 1912. A local advisory council assists the board.

The **Lord Howe Group**, also known as Ongtong Java, has a Polynesian pop. estimated at 1,200 (5,000 in 1905), and produces copra.

Loyalty Islands (dependency of New Caledonia), pop. (est., 1919), 11,000.

Macquarie Island is annexed to Tasmania. In connexion with the Mawson Antarctic expedition (see 21.968) a meteorological and wireless station was established there.

Manihiki Archipelago.—Of the scattered islands mentioned under this heading, Caroline, Vostok, and Flint are leased from the British Government by a coco-nut company; the rest are dependencies of New Zealand. Suvarov has a fine harbour, though with a shallow

¹ Statistics of the separate ex-German possessions in the Pacific are not available. Exports for them all, excluding Samoa but including New Guinea, were valued in 1913 at £595,000; imports at £450,000.

entrance, and a part of Anchorage Islet on the reef is held by the Lords Commissioners of the Admiralty. The island is leased to a coco-nut company, but producing little owing to destruction by hurricane, and the pearl fishery has deteriorated. At Manihiki I. (pop. in 1916, 775) the pearl beds were closed when almost worked out, and at Penrhyn I. (pop. in 1916, 312) production fell off.

Marianas.—The former German islands (excepting Guam [see GUAM], which belongs to the U.S.A.) were occupied by the Japanese in 1914, and were given to them under mandate in 1918.

Marquesas Islands.—The Polynesian pop. has continued to diminish, and was estimated in 1920 to be less than 3,500. The French administration (established at Hivaoa) was stated to neglect the commercial development of the islands, though in 1913 a German trading company was established there.

Marshall Islands.—These islands, formerly German, were acquired by Japan under mandate in 1918. From 1888 to 1906 they were administered by the Jaluit Trading Co., of Hamburg, under agreement with and subsidized by the German Government. The Government itself subsequently administered them down to 1914. A recent estimate indicates a decreasing pop. numbering 9,200.

Nauru.—This island, in 0° 33' S. lat., 166° 55' E. long., was administered along with the Marshall Is. by the Germans, but the phosphate deposits for which it is important were worked by a British company under agreement with the Jaluit company. The island surrendered to a vessel of the Australian navy in Sept. 1914 and came under British mandate in 1918. Pop. (1916), 1,284 natives, 449 Caroline islanders, 278 Chinese, 90 whites. The white settlement is at Yangor, where the phosphate company had its stores and drying plant. The deposits on the high ground (78 to 88% phosphates) are transported by light railways worked by steam, gravity, or electricity, and are shipped by surf-boats from two wharves. Under the Nauru I. agreement, 1919, between the British, Australian and New Zealand Governments, it was enacted that the Australian Government should appoint an administrator for a term of five years, that each of the three Governments should appoint a member of a board of commissioners, that the phosphate company should be bought out by the three Governments and the deposits and their workings should be vested in the board, and that the expenses of the administration, so far as not otherwise met, should be paid out of the sale of the phosphates. The island also yields copra. A wireless station was established by the Germans in 1913.

New Caledonia.—Pop. (census of 1911), 50,608, including 28,075 natives, 19,319 whites, and 3,214 Asiatic immigrants. Nouméa contained 8,961 inhabitants, including 5,207 free whites, 1,245 convicts, 1,999 natives and other coloured people, and 396 troops. Among other centres of population, Thio on the E. coast is the chief nickel-mining centre, and Paogoumène on the W. coast the chief chrome-mining centre. Exports from New Caledonia and dependencies were valued in 1913 at £633,536 (copra, £67,932; imports at £708,316. The guano workings of Walpole I., 150 m. E. by S. of Nouméa, have been recently developed by a company.

New Hebrides.—The pop. has been recently estimated at 65,000 natives and 800 Europeans. Exports in 1919 were valued at £364,000 (copra, £134,300; cocoa, £79,000); imports at £166,847. The Anglo-French condominium is not generally regarded as successful. According to a report of 1918, the confusion between the operations of this tribunal, the French and British courts, and the joint naval commission for native litigation, gave rise to complaints.

French settlers are said to hold the best land as a rule, though in the Banks and Torr Is. British interests are the stronger; trade has been fostered mainly by French interests. The volcano of Ambrym Is. was in eruption on and after Dec. 6 1913, and caused damage.

Niue.—Pop. (1919), 3,664, including 20 whites and 160 half-castes. Exports (about six-sevenths copra) were valued in 1919 at £35,977, and imports at £21,783. The New Zealand Government contributes about £3,000 a year to the administration. A hurricane in 1915 severely damaged the coco-nut plantations, but 15,000 nuts were planted in the course of peace celebrations.

Norfolk Island.—Pop. (Dec. 1918), 815. The executive council now consists of six elected members and six members appointed by the administrator. It was reported in 1919 that the Melanesian Mission established here in 1867 was contemplating the removal of its headquarters. Exports were valued in 1919 at £5,238 (lemons, passion-fruit pulp, fish and whale products); imports at £13,398.

Paumotu or Tuamotu Archipelago (the latter is the proper form, and is used throughout this part of the Pacific).—Pop. (1911), 4,581. Makatea (pop. 866) has become the most important island, owing to the working of phosphates, and is administered separately. It is an elevated coral island, unlike the other coral islands, which are atolls. From these, copra and pearl-shell are the chief exports. The dependent Gambier Is. yield the same commodities, but poorly, and their inhabitants are decreasing in numbers and physique.

Phoenix Islands.—The majority have been leased to the Samoan Mining and Trading Co., for coco-nut planting.

Tonga (to Fiji).—Pop. (1918), 2,263.

—The former German islands of western Samoa were taken by a New Zealand expeditionary force on Aug. 30 1914. It was stated that there was some feeling in the islands against the present administration by New Zealand, a mandate for

them was given to that Dominion in 1919. The native pop. in 1918 was 30,636 after the epidemic of influenza in that year, which caused over 8,000 deaths. There were also 1,660 white men and half-castes, and 1,166 labourers imported under indenture. The shortage of labour is particularly acute. The Deutsche Handels- und Plantagen-Gesellschaft (German trading and plantation company), which held 8,820 ac. under the German Government, went into liquidation in 1916, and its holdings and other German plantations were taken over by the Government of New Zealand. Exports in 1919 were valued at £532,500, over four-fifths of the total value being in copra, which went chiefly to the United States. In 1918 exports were valued at £366,640; imports (mainly from the United States and New Zealand) at £319,521. Revenue for one year 1919-20 was estimated at £80,215, and expenditure was expected to balance this. Apia has a wireless station. The pop. of the American Samoan islands was estimated in 1920 at 7,550. Copra is practically the only export. There is a high-powered wireless station at Tutuila.

Society Islands.—The pop. of the whole of the French establishments in Oceania in 1911 (including the Society, Tubuai, Tuamotu and Marquesas groups) was 31,477, including 2,656 French, 484 British, 237 Americans and 975 Chinese: there appears to have been a large influx of the last since that date. A later estimate ascribes 11,000 inhabitants to Tahiti alone, but 4,000 lives were lost in this and adjacent islands in the influenza epidemic of 1918. Papeete, the capital (pop. in 1911, 4,099), was bombarded by German cruisers on Sept. 22 1914. Exports were valued in 1917 at 11,997,461 francs (chiefly copra, pearl-shell, and vanilla), and imports at 7,806,294 francs. Papeete has a wireless station.

Solomon Islands.—The native pop. has been recently estimated at 150,000, the whites at 800, and there are a few Chinese. For the year 1918-9 revenue amounted to £29,476; expenditure to £30,205; exports were valued at £170,125; imports at £188,408. The natives are for the most part wild and backward, and the labour question is serious. For the (formerly) German Solomon Is. see NEW GUINEA.

Tonga.—Pop. (1919), 22,689 natives, 350 Europeans. The influenza epidemic of 1918 is said to have caused 1,000 deaths. The native government, under the king, consists of 32 nobles and the same number of elected members. The land is vested in the sovereign, but all his subjects hold some of it, and there is no pauperism or public debt. British officials assist the administration. The revenue in 1918 amounted to £58,340, and expenditure to £35,865. The value of exports in 1918 was £169,758, nearly the whole consisting of copra. Imports in 1918 were valued at £177,152. The copra is chiefly exported to America; imports are received mainly from Australia and New Zealand.

Tubuai Islands.—Pop. (1911): Ravaivai, 432; Tubuai, 543; Rurutu, 911; Rimitara, 415; Rapa, 183. Rapa, possessing a fine natural harbour in Ahurei Bay, has been spoken of as a possible trans-oceanic port of call, for which purpose it was used in 1867-9. The island is volcanic, and the bay represents the old crater. The natives are noted sailors and are in demand for the crews of vessels.

Wallis and Horné Islands.—These, formerly a French protectorate, have been declared a colony. When this annexation was proclaimed in 1913, opposition to the proclamation was fomented by Roman Catholic missionaries in Futuna (Horné Is.), and even in Uvea (Wallis), where the native chiefs had asked for the annexation, a retention of native law was stipulated, and native law could be only gradually replaced by French law.

(O. J. R. H.)

PADEREWSKI, IGNACE JAN (1860—), Polish pianist and diplomat (see 20.443), after the outbreak of the World War in 1914 gave numerous benefit concerts in America for Polish sufferers and delivered addresses in their behalf. He was appointed plenipotentiary in America for the National Polish Committee, which early had won official recognition by the Allies.

Among the Poles in America—some millions—there was great dissension as to the means of gaining independence for Poland. With rare skill he induced the stubborn factions to accept the authority of the National Polish Committee, of which he was the most influential member in Paris. In the words of Mr. Robert Lansing, who, as a peace delegate, came into constant contact with him there, he was "an able and tactful leader of his countrymen and a sagacious diplomat." He was among the statesmen, who, in Paris, Dec. 1918, formulated the terms of the Peace Treaty. Meanwhile discord had arisen between the Polish Government and the National Committee. At the close of the year Paderewski returned to Poland and was received in triumph. In Jan. 1919 an agreement was reached with Gen. Pilsudski, whereby Paderewski headed a new coalition cabinet as premier and minister for foreign affairs. In this capacity he signed, June 28 1919, the Treaty of Versailles. He resigned as premier in Dec. 1919. It was generally felt that he had been more successful as a diplomat than as an administrator. In an interview given to newspaper reporters after his return to America in Feb. 1921, he asserted that he would never again appear in piano recitals. His last professional appearance as a pianist had been at the Metropolitan Opera House in New York, May 9 1917.

PAGE, THOMAS NELSON (1853—), American author and diplomatist (see 20.450), was appointed ambassador to Italy by

President Wilson in April 1913. In 1914 he announced his discovery of the house, 66 Piazza di Spragna, in which Byron had lived at Rome in 1817. In 1915 he induced the Italian Government to raise the ban on the reexportation of cotton goods routed by American shippers via Italy to other countries. He earned the gratitude of the Italians by his relief work during the Avezzano earthquake in 1917. After America entered the World War he defended Italy against the charge of backwardness in conducting her campaign by pointing out the obstacles confronting her soldiers in the Alps.

He resigned as ambassador in April 1918 and returned to America. His writings after 1910 included *Robert F. Lee, Man and Soldier* (1912); *The Land of the Spirit* (1913); *Tommaso Jefferson, Apostolo della Libertà* (1918, prepared for an Italian series); *Italy's Relation to the War* (1920) and *Italy and the World War* (1921).

PAGE, WALTER HINES (1855–1918), American editor and diplomatist, was born at Cary, N.C., Aug. 15 1855. After graduating from Randolph-Macon College, Va., in 1876, he was appointed one of the first 20 fellows of the newly established Johns Hopkins University. He taught for a time in Louisville, Ky., and then accepted the editorship of the St. Joseph, Mo., *Daily Gazette*. After two years (1881) he resigned to travel through the South, having arranged to contribute letters on southern sociological conditions to the *New York World*, the *Springfield Republican* and the *Boston Post*. These letters were helpful in educating the North and the South to a fuller understanding of their mutual dependence. In 1882 he joined the editorial staff of the *New York World* and wrote a series of articles on Mormonism, the result of personal investigation in Utah. Later in the same year he went to Raleigh, N.C., where he founded the *State Chronicle*, but returned to New York in 1883 and for four years was on the staff of the *Evening Post*. From 1887 to 1895 he was, first, manager and, after 1890, editor of *The Forum*, a monthly magazine; and from 1895 to 1900 was literary adviser to Houghton, Mifflin & Co., and for most of the same period editor of the *Atlantic Monthly* (1896–99). When the house of Doubleday, Page & Co. was organized in 1899, his duties were divided between editorial and publishing work, for he was not only a partner in the publishing house but also editor of its magazine, the *World's Work*. In March 1913 President Wilson appointed him to succeed White-law Reid as ambassador to England.

Mr. Page was hardly known in England when he was appointed, but during his tenure of office he gradually established himself as one of the great line of American ambassadors. None had ever worked more assiduously than he did for Anglo-American solidarity, and his speeches—though he was no orator—were always marked by absolute sincerity and by well-informed appeals to history. His position was a delicate one after the outbreak of the World War, when German and Austrian interests in England were placed in his hands. He was thoroughly loyal to his country in his conduct, although sympathetic with the Allies. Among the problems with which he had to deal were the British claim of the right to stop and search American ships, including examination of mail pouches; the commercial blockade (1915) and the "blacklist," containing the names of American firms with whom all financial and commercial dealings on the part of the British were forbidden (1916). He had the satisfaction of seeing the United States through its period of neutrality without friction, and then representing it as a partner in the war. In Aug. 1918, finding his strength exhausted, he resigned as ambassador and returned to America in September. He was critically ill on arrival, and after a short rally died at Pinehurst, S.C., Dec. 21 1918. No man ever served his country, or the cause of Anglo-American friendship, more strenuously. While in Great Britain he was honoured with degrees by the universities of Aberdeen, Edinburgh, Sheffield, Cambridge, and Oxford. He was the author of *The Rebuilding of Old Commonwealths* (1902) and *The Southerner, a Novel: Being the Autobiography of Nicholas Worth* (1909).

PAGET, FRANCIS (1851–1911), English divine, was born March 20 1851, the second son of the surgeon Sir James Paget (see 20.451). His brothers, Sir John R. Paget, 2nd Bart., the

lawyer (b. 1848), the Rt. Rev. Luke Paget (b. 1853), who was Bishop of Stepney, from 1909 to 1919, and was then translated to the see of Chester, and Stephen Paget, the surgeon and author (b. 1855), all became well-known men. Francis Paget was educated at Shrewsbury and Christ Church, Oxford, where he had a distinguished career, taking first classes in classics, winning the Hertford scholarship (1871) and the chancellor's Latin verse prize (1871); he was elected senior student of Christ Church (1873) and tutor (1876), taking holy orders in 1875. In 1885 he was appointed regius professor of pastoral theology, and in 1892 dean of Christ Church. He contributed the essay on the sacraments to *Lux Mundi*. He became Bishop of Oxford in 1901, and was a member of the Royal Commission on Ecclesiastical Discipline 1904–6. He died in London Aug. 2 1911.

PAGET, LOUISA MARGARET LEILA WEMYSS, LADY (1881–), was born in London Oct. 9 1881, the daughter of Sir Arthur Henry Fitzroy Paget (b. 1851), a descendant of the 1st Marquess of Anglesey. She married in 1907 a connexion of her own, Sir Ralph Spencer Paget, who had a distinguished career in the diplomatic service, and was from 1916 to 1918 minister to Denmark and from 1918 to 1920 first ambassador to Brazil. In 1915 Lady Paget organized a Red Cross hospital for service in Serbia, and was stationed at Uskub, having to remain there when the town was occupied by the Bulgarians, Oct. 1915. She was allowed to use her stores for the relief of refugees, and relieved a great deal of suffering. In Feb. 1916 she was transferred to Sofia, and in April returned to England. In 1915 she was invested with the order of St. Sava by the Serbian Government and in 1917 received the G.B.E.

PAINTING (see 20.450).—The end of the 19th century saw in painting the triumph of "impressionism" in its widest sense and the reproduction of visual appearance as a whole accepted as the main business of a painter.¹ But with the heterodoxy of the 19th century become the orthodoxy of the 20th, another movement has arisen in revolt against impressionism, giving to painting between 1900 and 1921 its distinctive character: and just as the victory of impressionism was a French victory, so this new movement is mainly French in origin, though its manifestations elsewhere have taken colour from national characteristics. The change in the centre of gravity of art has, however, been greater in appearance than reality. The older academic traditions still survive; and advances by official bodies and the public have been met by concessions to orthodoxy among some followers of 19th-century heretics.

Across these main movements has cut the influence of the World War. At first it threatened to limit artistic output severely, but the check was only temporary. A huge demand arose in the belligerent countries from individuals and public bodies for illustrative, propagandist or commemorative work, which bore fruit in posters and cartoons; in the formation of official collections such as the Canadian War Memorials and a section of the Imperial War Museum; and in decorative paintings for memorial purposes, such as have been commissioned in France by the State and municipalities. The chief interest of this work is that of a document, showing what men did, felt and thought during the war, and of giving a summary of the condition of art at the time in various countries. The aim of the British and Canadian official collection was definitely to preserve a pictorial record of the war in all its aspects, and, consequently, much of the work is only the skilful application of a technique to a set task, and not the expression of a new vision. The same applies to most of the memorial decorations produced in France; only some etchings and lithographs produced independently of official action show any really personal emotion. Similarly, though in all countries the posters were the work of prominent artists, little

¹ Unfortunately for clarity of exposition, the term "impressionist," originally applied to the group of artists round Claude Monet, painters in a high key using a palette limited to white and the spectral colours, has been given a wider meaning, especially in England. To avoid mistake, the term is here used throughout to describe that group and their followers, and does not cover painters such as Monet in his early period, or Whistler, whom the wider significance might include.

really notable work from an aesthetic point of view appeared. Designed as they were to excite hatred, cupidity, pity and self-sacrifice, their appeal could only in part be aesthetic, and, like the paintings, they showed little more than the application of familiar and matured methods to a special end. Yet by putting the production of the poster into the hands of artists, and by helping to revive and stimulate wood engraving and lithography, the war has had real influence on the graphic arts. Otherwise, its immediate effects have been small. It has quickened a movement towards expression of a national spirit in art, by throwing countries back upon their own resources, and by increasing a desire to assert national superiority. It may also have given a new impulse to the modern search for structure and design, by reducing life so much into terms of machinery and organization; and because of the depth and variety of the emotions it aroused, may have stimulated the tendency to use form and colour for the expression of personal feeling rather than for the reproduction of nature. Probably, too, by making a definite breach with 19th-century ideas, the war has cleared the way for the development of new aesthetic standards. But the most important modern movements in art were in being before the war.

Impressionism.—Of movements which attained full development in the 19th century, impressionism in its purest form was still represented in France in later years by Claude Monet, in Belgium by Emil Claus, and in England by Lucien Pissaro. Of its many developments and adaptations, neo-impressionism—based on the analysis of colour in nature into its constituent elements, which are then placed by means of juxtaposed spots of paint upon the canvas, to be recombined by the eye—survived in 1921 only in modified form. Paul Signac, one of its original exponents, had substituted for spots brick-like rectangles in his oil paintings, and increased use of line in his water-colours; while its conversion into pointillism (simply a method of applying in spots colour already mixed on the palette) was represented by Henri Martin and Henri le Sidaner. Paul Albert Besnard showed impressionism adapted to deal with such complicated problems as a mixture of twilight and artificial light; but with Wilson Steer the expression of subtle tone relations with a limited palette including black had superseded an impressionist technique. In England, indeed, the spectral palette and high key has been only a passing phase with most painters, and it is the impressionism of Whistler and the earlier Manet, with its study of tone and decorative arrangement of silhouette, which has obtained most adherents. This was seen in its purest form in France in the work of Jacques Émile Blanche; but it provided a common basis for the members of the Glasgow school, such as Sir James Guthrie, E. A. Walton, Sir John Lavery and D. Y. Cameron; and brought into relation with them Sir William Orpen, whose use of colour and study of light otherwise connect him with the impressionists. Similarly J. S. Sargent's portraits carried on one side of the Manet tradition, though elsewhere he showed impressionist influence. Of the group of painters who, under the influence of Millet and Bastien-Lepage, carried the realism of Courbet and Manet into the field and workshop, the chief survivors in 1921 were Lucien Simon and Charles Cottet in France, Max Liebermann in Germany, Joaquín Sorolla in Spain and Ettore Tito in Italy. In England the once prominent Newlyn group had fallen by 1921 into obscurity; in Sweden Anders Zorn, best known by his portraits and etchings, was dead; and the Hague School of Holland had no important living representatives.

Transition Painters.—Between these representatives of the 19th-century outlook and those of the modern movement stand many painters combining in varying degrees characteristics of both groups, such as Sir C. J. Holmes (Director of the National Gallery from 1916), whose landscapes are marked by simplification and emphasis on structure. Transition to the modern point of view is also represented by the decorative painters, who have rarely never fully accepted impressionism and realism. As early as 1892 the *Rose Croix* group had urged that painting should be idealist and monumental in character, with myth and its subject. These ideas survive, despite impressionism, in the balanced and harmonious compositions of

René Menard, whose descent is from Puvis de Chavannes, in the mural decorations of Henri Martin, and in the work of Aman-Jean, whose flowing arabesque relates him to the 18th-century decorators. Akin to these painters, but closer to the modern movement and more purely decorative in intent, is the broadly handled work of Jules Flandrin (b.1871). Another group of decorative painters take realism as a starting-point. Among these is Frank Brangwyn (b.1867), one of the few English painters with considerable European influence and reputation. His later work—such as the eight mural paintings, symbolizing the dynamic forms of nature, for the 1915 Panama Pacific Exposition—shows how his dexterous and schematized art combines romantic and allegorical treatment of material drawn from the daily life of commerce and industry with a sensuous materialism. A comparable figure is Ignacio Zuloaga (b.1870), the leader of a group of Basque and Castilian painters, including Ramon and Valentine de Zubiaurre, Gustavo de Maeztu and Federico Beltran-Masses, representing the regionalist and consciously national character of modern Spanish art. Here a romantic conception of subjects drawn from contemporary Spanish life is given decorative form by emphasis on silhouette, simplification of form and broad masses of colour, often combined with a low horizon and a panoramic background; though sometimes the realism degenerates into caricature and the decorative treatment into the production of cardboard figures against a stage drop-scene. Augustus John (b.1879) in England is not romantic, but combines with the realism which finds most complete expression in his portraits a strongly decorative aim in the use of contour to enclose definite areas of colour, and distortions of the human figure in the interests of design. Similarly, the Munich decorative school, still represented in 1921 by its most important product, Franz Stuck (b.1863), inherits from Böcklin the realistic treatment of mythological and allegorical materials. Its once important and widespread influence has waned; but it forms part of the bridge between the archaeological and historical painting which formerly dominated Germany, and more modern movements. Allied thereto is the Swiss, Ferdinand Hodler (1853–1918), by the emphasized contours and calculated distortions of his later work. But in his symbolic mystical outlook he resembles another important forerunner of the modern movement, Hans von Marées (1837–1887), neglected in his lifetime but now the object of much adulation, who turned from Courbet and Manet to Rubens and Delacroix in developing a monumental decorative art based on three-dimensional form.

Another important divergence from the main trend of later 19th-century art is represented in France by H. G. F. Degas (1834–1917) and Pierre Auguste Renoir (1841–1919). Their close association with the impressionists was reflected in the choice of subjects from contemporary daily life and at times in their use of colour; but here the connexion ends. Degas is a descendant of the great classic draughtsmen. A convinced realist, bitterly opposed to the romantic and symbolic, he never sought the ideal beauty of Ingres, but turned to use the more absurd and bizarre attitudes of everyday life. But his realism is synthetic, and represents the building-up, from many sketches and from a retentive memory, the essential character of a form or movement; and his vision is classic in its impersonal, almost ironic, quality. So with his design, which, despite its apparent disregard of the rules of classical composition, yet shows a complete balance of strains and stresses round a pictorial centre, revealing the influence of Chinese and Japanese art. Round Degas centres a group of realistic draughtsmen, such as Henri de Toulouse-Lautrec (1864–1901), whose fevered and excited vision has inspired much modern work, Louis Legrand and J. F. Raffaelli. Jean-Louis Forain (b.1852), chiefly known for his political and social cartoons, has the critical and ironic spirit of Degas, but less power of design and feeling for colour. The later work of T. A. Steinlen (b.1850), likewise well known by his journalistic work, is significant of modern tendencies in the increased emphasis given to the third dimension and the use of simplified forms. In England the realism and irony of Walter Sickert (b.1860) connect him with Degas, though his search for atmospheric

unity by study of tonal relations, and an incursion into the use of the spectral palette under the influence of Spencer Gore, bring him nearer the impressionists. He has played an important part in English art by transmitting French influence, coloured by his own personality, to a number of younger men. Henry Tonks (b.1862), professor at the Slade School, London, has also played an important part in moulding the younger generation. His realism and draughtsmanship relate him to Degas, his choice of subject at times to Renoir. Renoir, unlike Cézanne, to whom he is most immediately comparable, has inspired no particular group who call him master. He was first and last a painter, not the exponent or founder of an aesthetic creed. Rejecting Monet's principle of unconditional submission to nature, and holding that the work of a painter was not to reproduce a natural effect but to compose and construct, he grafted impressionism on to the tradition based on the Venetians and Rubens and revived by Delacroix; forming an art in which solid form, simplified to its most expressive elements, and rhythmic flow of contour unite to give his work the plastic quality of a bas-relief. His colour, always daring and exuberant, in his later work becomes less naturalistic, and is dominated by the famous Renoir carnation, which gives his canvases a radiance in accord with his vision.

Etching and Engraving.—In etching and engraving, broadly, the 19th-century tradition originating in Rembrandt and Goya still holds the field, represented by Georges Gôbo in France, Otto Fischer in Germany, Sir Frank Short, Muirhead Bone and D. Y. Cameron in England. Confined as a rule to landscape or architectural work, their work is chiefly notable for technical mastery. Representatives of the modern school, on the other hand, rarely realize the full possibilities of the medium. In Odilon Redon (1840-1916), however, a modern aim is united with the older craftsmanship in his search for a plastic equivalent of his emotion and dreams. He was one of the pioneers of that revival of lithography in which bodies such as the Senefelder Club, whose members include Joseph Pennell and Brangwyn, played a part. A more important revival is that of engraving upon wood, with which Auguste Lepère (1840-1918) was closely associated. His later woodcuts show a return from a technique imitating etching or engraving on metal to the older method of treatment in broad masses, the lights being obtained by cutting away the wood. In Paris and London societies of wood engravers have been formed whose members practise this traditional use of white upon black, which is also much favoured by such modern artists as Derain, Dufy, Friez, and Franz Marc in their book illustrations.

Contemporary Movements.—The modern movement, some of whose characteristics appear in the transition painters already discussed, has been given various labels, such as post-impressionism and expressionism, but its manifestations are so various that no one term can satisfactorily describe it. But these manifestations have a common origin and character, in being a reaction against impressionism, with its aim of representing superficial appearance as a whole at a given time, without reference to shape or appearance as they are known to exist under the conditions; and in proposing to substitute form arranged into a coherent design, so making a new and independent reality and not a reproduction of nature. In this the modern movement claims to be a return to the tradition in painting represented by Raphael, Poussin, David and Ingres, as opposed to the romanticism and realists; and to be breaking away from subordination to external and visible things, which are to serve only as a means towards expressing the artist's emotions. From this latter aspect of the movement arises the term "expressionism"; and divergence as to the kind and quality of emotion to be expressed is one cause of the differences between various modern groups. This general character of the movement helps to account for other distinctive features. Colour becomes less naturalistic, and is either used to emphasize the solidity of objects, is purely decorative, or assumes a mystical and symbolic character; and anxiety to avoid a transcript of nature has stimulated return to the subject picture, which calls for constructive effort. But the modern movement owes much to the impressionists. It was they who helped to discredit the formulas and aims of academic art; put powerful

weapons in the painter's hands by applying to art scientific discoveries regarding light and colour; and won recognition of the artist's freedom to express his personal vision of things. It was on this basis that the chief initiators of the movement built. These fall into two groups, the one including Cézanne, Seurat and Henri Rousseau, whose emphasis tends to be on structure and organized design; the other including Gauguin, Van Gogh and Gustave Moreau, in whom symbolist and expressionist elements are more marked.

Paul Cézanne (1840-1906) gives the key to understanding of his aims and methods by his own words, that he wished to remake Poussin according to nature, and to make of impressionism something solid and durable like the art of the museums. His sympathies were all with the later Venetians, Rubens, Poussin, and the baroque masters such as the Caracci and El Greco, whose craftsmanship, bravura and well-organized design he admired. These sympathies found expression throughout his life, but are most evident in his earlier work. In this he used little colour; but under the influence of the impressionists, especially Pissarro, he extended his palette considerably (though still retaining black and the earth colours) and turned to a more intimate study of nature. But for him nature was only a starting-point. Contemplation of her, he held, reinforced by reflection and study of underlying causes, creates in the artist's mind a vision of the structure underlying the external, visible world, which to him becomes a series of organic relations between solid forms, which it is his business to realize on canvas. Cézanne's method was to establish the relations between the planes enclosing an object or group of objects by recording all the subtle differences in their colour due to differences in their relation to the light. But it is the form, not the light around it, which interests Cézanne. He worked slowly and painfully; but such was his desire for keeping every element of his work in correct relation that one alteration would often lead to complete repainting. The legend of Cézanne's technical incompetence is partly due to his constant self-depreciation and to the amount of work he left unfinished in despair or disgust. Though his ultimate rank as a painter is still in the balance, his influence underlies much of modern art.

Georges Seurat (1859-1891), like Cézanne, found in the 16th- and 17th-century masters the inspiration to recreate on canvas a world of three dimensions rather than copy that before his eyes. At the same time modern scientific research into colour led him to develop his well-known neo-impressionist technique, which has rather obscured his power of expressing structure and of welding form into balanced and monumental design. But he has exercised much influence, especially on the cubists, whose studio walls often carried reproductions of "Le Chahut," one of his last pictures.

Henri Rousseau (1844-1910), "le douanier," a very different figure was once an octroi official in Paris (whence his nickname). He is the true type of the primitive who tries to paint things as he knows them to be rather than as they appear. He used, for example, to measure his sitters with a footrule, and transfer these measurements to canvas. His work, which includes portraits, views of the suburbs of Paris, exotic landscapes based on recollections of military service in Mexico, and figure compositions, is marked by emphasis on solidity, precision of handling, adjustment of the relative size of objects according to their importance as elements in design, and at times by a symbolic element.

In contrast to Rousseau is Gustave Moreau (1826-1898), a strange figure bred in the strictest academic tradition, whose romantic spirit borrowed fire from Delacroix and Chasseriau, and who fed his imagination upon the myths of Greece and the East. He emerged from many years' retirement to become at the end of his life professor at the École des Beaux Arts, where his influence helped to breed a group of young painters with symbolist tendencies. As a teacher Moreau always encouraged self-expression based on close study of the old masters. In his own work Moreau stood for the use of the plastic arts to express the emotions, and built up a decorative art, combining sombre rich colour and rhythmic linear arabesque.

Paul Gauguin (1848-1903) was more definitely a *chef d'école* than any of the group now under consideration. After an impres-

sionist phase, he became in Brittany the centre of the famous Pont Aven group, and there developed the theory of synthesis which was to govern all his later work. In 1891 he went to Tahiti and, except for a brief return to France, spent the rest of his life there. Admiration of the primitive was at the base of Gauguin's art. Rejecting impressionism as a mere reproduction of nature not inspired by thought, he held that study of nature awakes emotions in the artist which he has to express by bringing into organized relation symbols, consisting of forms and colours, supplied by nature. Primitive art alone, he considered, proceeds from the spirit, and uses rather than mimics nature; and he justified going to Tahiti on the ground that there only was his imagination sufficiently stirred by nature. Though the colour and forms in his pictures might not actually exist in nature, he claimed them to be the pictorial equivalent of the grandeur, profundity and mystery of Tahiti. His latest work most completely embodies this conception of art in its design based on boldly simplified contours enclosing areas of rich purples, greens, reds and oranges. To the end Gauguin's colour showed impressionist influence. Otherwise his art is primarily decorative, with colours keyed to express the painter's mood, and shows a less passionate search for solidity than Cézanne's. His symbolism, though not primarily literary, towards the end moved somewhat in that direction.

Akin to Gauguin in his outlook and use of colour is Vincent van Gogh (1853-1890). Born in Holland, his early work shows the influence of the Hague School; association with the impressionists in Paris led to his settling down at Arles to the use of heavy masses of vivid colour arranged in indefinite patterns, emphasized by black outlines and writhing arabesques of paint. A passionate lover of nature and a mystic and idealist by temperament, Van Gogh believed that the artist's creative power was given to him to make men happy. Vehement personal passion is the note of his work. His colour ultimately became quite non-naturalistic, and was solely directed towards expressing his emotions; and his surface texture was designed to increase the arresting, disquieting quality of his work. The third dimension did not play a dominant part in Van Gogh's work. His design, in which decorative simplification became increasingly marked, shows very strongly the influence of Japanese art.

Symbolism and Fauvism.—The characteristic elements of the preceding group of painters—rejection of naturalistic representation, emphasis on solidity and structure, organized design, and the symbolic use of form and colour—are united in varying degrees in the work of their successors. The influence of Cézanne, which has modified or supplanted that of others, took some time to develop, and the first well-marked group to appear was that round Gauguin at Pont Aven. Among these was Paul Sérusier (b.1864), who was one of the first to formulate a doctrine based on the ideas of Gauguin, Cézanne and Odilon Redon. He drew round him a group of *symbolistes* which included Maurice Denis (b.1870), Pierre Bonnard, K-Xavier Roussel and Edouard Vuillard. This doctrine declares that a work of art must aim at the expression of an idea. Since it uses form for this purpose, it must be symbolic; and since the form has to be organized, it must be synthetic and decorative. At the basis of this is a belief in correspondence between external forms and subjective states—not, however, by association but direct. Sérusier and Denis have given these ideas a mystical and religious application, largely under the influence of the *quattrocento* Italians. In Bonnard (b.1867) and Vuillard (b.1867), however, the purely decorative element is uppermost, in a graceful and refined but over-precious treatment of material drawn from everyday life, influenced by Japanese art, and marked by elusive and delicate harmonies of green, blue, rose and yellow combined with grey. Closely akin to this *symboliste* group is another whose best-known members are pupils of Gustave Moreau. The religious symbolic pictures of Georges Desvallières (b.1861) are characterized by the use of masque and rich exotic colour; the more realistic art of Jean Guérin (b.1874) by its decorative aim and search for form rather than linear unity. The influence of Moreau, modified by the pupil's own temperament, is well seen in the vaguely distorted nudes, and mysterious, sombre

landscapes of Georges Rouault. Far better known is his fellow-pupil Henri Matisse (b.1869), who represents the expressionist side of symbolism in its most extreme form. Academic and neo-impressionist phases never obscured his very personal use of line and colour whose decorative quality relates him to the Chinese and Japanese. His arbitrary distortions of the human figure, partly based on the study of negro art, marked a stage towards the abstract, non-representative art of the cubists. These distortions, his apparently anarchic design and his colour earned for Matisse the title of "Chef des Fauves," though he has not formed the centre of a well-marked group, despite his wide influence. It is difficult to acquit him of sometimes painting *pour épater les bourgeois*; but his latest work, while retaining delicacy and sensitiveness, shows increased discipline and restraint. Both in his drawing and painting Matisse is notable for his use of a pure unaccented contour, which nevertheless generates solid form. Somewhat the same power is seen in the Italian painter and sculptor Amédée Modigliani (1884-1920), though he is far more mannered than Matisse and lacks his feeling for colour.

Kees van Dongen (b.1877, in Holland) mingles the influence of Matisse with that of Toulouse-Lautrec, and mainly shows the application of a *fauviste* recipe to the painting of fashionable Parisian society. Different from the *symbolistes* and *fauves*, but equally a reaction against impressionism, are the painters who return to the outlook and methods of the *quattrocento* Italians. Among these are Jean Frélaud (b.1879), notable for his sincere, thoroughly realized interpretations of the country and people round Morbihan in Brittany; and Félix Vallotton (b.1865, at Lausanne), whose angular, precise contours and definite colour pattern relate him to the primitives, and have won him the nickname of the Cabanel of the Salon d'Automne. This Pre-Raphaelite tendency is represented in England by Joseph Southall, head of the Birmingham School of Art, whose work is akin to that of Benozzo Gozzoli; and by Henry Lamb, Stanley Spencer and Gilbert Spencer, who in 1921 were the most prominent of a group of younger men in London of undoubted sincerity but inclined at times to use a rather elementary formula. Their work is also interesting as illustrating a tendency in British art towards decorative design suitable for mural painting. Similar, though more academic in outlook, is Eric Kennington, whose war paintings attracted much attention, their sentimental interest obscuring their mannered draughtsmanship and pretty colour.

Cubism.—To all the manifestations of the modern movement so far considered cubism is a marked contrast. It was a reaction not only against impressionism but against fauvism, and stands for the introduction of order and discipline into painting. So much was this the case that some opponents of the movement professed to see therein a return offensive of the academics. It owes its name and in part its origin to Matisse, from whose association with Picasso and others the movement took shape in 1908. This group coalesced with another working on similar lines, and represented by Albert Gleizes and Jean Metzinger, to win cubism its first public victory in the Salon d'Automne of 1913. To the influence of Cézanne and Seurat, which was mainly behind the movement, was joined that of Negro and Polynesian art, in which the cubists found a simplification of the human form emphasizing its bulk and solidity, and a complete disregard of normal appearance in the effort to express a conception. The central point of cubism is its entire rejection of the reproduction of natural appearance, which, cubists hold, merely serves to awaken in the artist emotions which he expresses by a series of abstract forms, ordered and arrayed by his will. Thus cubism aims at creating a kind of visual music. In its most austere form it avoids curved lines and colour as pretty and sentimental; and even holds that a picture is not a decoration since that term implies dependence upon external objects. From the first, great emphasis was laid on the expression of volume and its arrangement in space. This aroused difficulties, which have separated the cubists into distinct groups. The representation of a third dimension introduced an element of resemblance to nature. Some painters accepted this, so that their pictures are little more than arrangements of realistically painted cubes and cylinders: others rebelled against such

a restricted art, and made of cubism merely an exercise and discipline in the expression of three-dimensional form. The purists, however, hold that art is not concerned with Euclidean space but with a special pictorial space, which we feel by our whole personality expanding or contracting before a picture; and that it is not the painter's business to create an illusion of a third dimension but to make live on a two-dimensional surface a reality of three dimensions. Further difficulties have been caused by development of a theory of simultaneity which justifies presentation on the same canvas of several aspects of the same object; this often only comes to a mechanical arrangement of a number of separate impressions, whose disentanglement may be a source of interest, so that cubism is descriptive rather than pictorial.

Pablo Picasso (b.1881, at Malaga) has been the dominating force in the movement, but by no means typifies it. With him cubism has been only a phase. To a realistic period, mainly influenced by Toulouse-Lautrec, succeeded a group of reddish nudes, solidly constructed from simplified planes, which ushered in the cubist period. The earlier work in this showed some conformity to natural appearance, and was mainly in *grisaille*. Later the forms became more abstract, the design more arbitrary and the colour brilliant, sand and similar substances being embedded in the paint to give relief and variety of surface. Picasso's latest phase shows the influence of Ingres, especially in his drawings. Some of these show a delicate, unbroken contour, others the use of shading; but all conform closely to natural appearance, with only enough distortion to give flow and rhythm. The chief characteristic of Picasso is his versatility. There is no method he has tried which he has not mastered. But whether he has yet achieved more than a series of exercises in different manners is open to question. The work of other cubists is remarkable for its sameness and impersonal quality. Georges Braque's rigid adherence to abstract forms, straight lines and sombre browns and greys make him the purist of the movement; Gleizes and Metzinger, by their more graceful use of line and colour and by their writings, are its popularizers; while Fernand Leger and Auguste Herbin are mainly makers of attractive patterns in bright colour. The use of colour is, however, pushed furthest by the Orphists, such as R. Delaunay, whose rejection of all rules is really a protest against the formal side of cubism, which he has translated into terms of curves and circles decked with vivid colour.

Between the extremes of cubism and fauvism stands a considerable group of artists who derive something from both, but represent the direct and increasing influence of Cézanne. Of these Albert Marquet (b.1875) is primarily a painter of Paris and of the Seine, whose use of well-defined planes, with their tonal relations very accurately expressed, is apt to degenerate into an ingenious system of notation. Jean Puy (b.1876), in his landscapes of wide-stretching countrysides, brings many scattered elements into harmonious relation by his feeling for subtle variations in colour and tone. With Othon Friez (b.1879) the organizing constructive instinct is uppermost, but he shows considerable power of retaining fresh and unspoiled his original conception. More consciously decorative than Cézanne, his mural paintings sometimes show the influence of Gauguin. Jean Marchand (b.1883) and Dunoyer de Segonzac (b.1884) represent a younger generation to whom cubism has been a gymnastic to develop understanding of form, but who now rely on colour and tone to give solidity and a sense of space. Marchand, taking for his material the most ordinary objects of daily life and the countryside, and using a simple, sober palette, gives his work distinction by his dignified design; Segonzac, with similar constructive power, works in a thick impasto with free use of the palette-knife in colour which has become increasingly sombre. His war paintings express a very personal emotion awakened by experience, and are the colour of the mud which dominated the battlefield. André Derain (b.1880) is one of the most influential of younger painters who, after a period influenced by Van Gogh and the neo-impressionists, produced a series of truculent nudes and landscapes, which showed cubist and fauve influence in their simplified and distorted forms. His recent work is more sober and severe, and reflects a study of Ingres. At times Derain's technical accomplishment threatens

to lead him into the mannerism which marks the dramatic landscapes of Maurice Vlaminck (b.1876), with their heavy skies and contrast of sombre greens with vivid reds and pinks.

Futurism.—Modern art in other countries is mainly an extension or adaptation of French ideas and method. Spain, it is true, has produced Picasso; but cubism is entirely Parisian in origin, and so much of the modern spirit as appears in Catalan painters such as Sunyer and Casals is derived from France. Futurism, however, is indigenous to Italy. The term has been loosely used, especially in England, to denote the modern movement as a whole; but it has a definite and limited application to the doctrines of a group of Italian poets, sculptors and painters, first presented to the world in 1909 in a manifesto signed by F. T. Marinetti, the poet and high priest of the movement. These doctrines apply to art a general philosophy of life, with its origin in modern scientific theories which express all matter in terms of energy, and are based on denunciation of all that the past has done (whence the name futurism) and on the worship of movement and conflict as the dominant characteristics of modern life. Cubism, as based on tradition and dealing only with the static aspects of life, it rejects; impressionism it claims to have surpassed, but takes as a starting-point. The futurist's aim is to represent, not the appearance of objects at some particular point in their course, but the sensation of movement and growth itself. One method, which connects futurism with cubism, is to combine on one canvas not only what the artist sees, but what he knows and remembers about an object. Another, peculiar to futurism, is the use of "force lines." Every object, it is argued, is at a given moment the temporary outcome of continuously acting forces, whose character is indicated by the lines and planes enclosing it. Thus an object becomes simply the beginning or prolongation of rhythms conveyed to the artist by contemplation thereof; and these he represents in his picture by lines arranged to clash, harmonize, or interplay in order to express states of mind such as chaotic excitement, happiness or interest. Colour the futurists use arbitrarily to assist in conveying these sensations.

Luigi Russolo is the most logical and orthodox of the futurists. The work of others, such as Carlo Carrà, is little more than a catalogue of information about a number of different objects; though Umberto Boccioni, who has applied futurist theories also to sculpture, sometimes redeems his work by an interesting design. The gaily coloured, tapestry-like patterns of Gino Severini are among the most attractive futurist paintings; but his recent work has been modified by cubist and academic influences. His career typifies the fate of futurism, which has found no new recruits, and has had but transient influence.

Modern English Painting.—The English vorticists share some of the futurist doctrines; but the main forces shaping the modern movement in England are French. This movement first took shape in the studio of Walter Sickert, and resulted in the formation of the Camden Town group under the presidency of Spencer Frederick Gore (1878-1914), which developed into the more eclectic London group, whose first president was Harold Gilman (1876-1919). At the same time Roger Fry (b.1866), by his writings and by assisting to organize post-impressionist exhibitions in 1910 and 1912 at the Grafton Galleries, did much to make known the character of the modern movement in France, and to assimilate more closely thereto the English movement. Gore and Gilman represent the movement in its earlier stages. Gore's earlier impressionism was modified under the influence of Cézanne and Van Gogh by increased attention to structure and design, which for a time obscured his charming sense of colour. This reappeared in his latest and most important work, done mainly at Richmond. Gilman emerged from a period influenced by Whistler and painters of the Vuillard type to one which gave increased emphasis to the third dimension and showed the influence of Van Gogh in the use of brilliant, clear colour and the handling of paint. Charles Ginner, whose work is closely akin to Gilman's, describes their art as aiming at "the plastic interpretation of life through intimate research into nature." The emotions aroused by nature in the artist he must express by deliberate and objective transposition of nature on to canvas, so that he reveals the qualities in her

which have moved him. The variety of line and colour in nature, joined to the artist's personality, will produce a decorative composition. This neo-realism (as Ginner calls it) is based on the attitude of Cézanne and Van Gogh towards nature; but gives an English turn to that attitude by emphasizing the part played by nature as compared with that of the artist. The French point of view is more evident in the work of the London group. Some of its members are still slaves to a French formula; others have based on French teaching a more individual art, notably W. B. Adeney, F. J. Porter, Roger Fry and Duncan Grant, whose sense of colour gives his art characteristic quality. C. R. W. Nevinson, having explored in turn impressionism, futurism and cubism, subsequently abandoned the geometric convention which marked his war paintings, to reveal the academic art masked by his previous experiments.

Vorticism.—Distinct in character is the vorticist movement, with which Nevinson was once associated. This had its origin in 1913 among certain members of the Camden Town group, and had as its leading figures the painters Percy Wyndham Lewis, Cuthbert Hamilton, Frederick Etchells, Edward Wadsworth and William Roberts, the poet Ezra Pound, and the sculptor Henri Gaudier-Brzeska (1891-1915). Like futurism, it holds that modern art must be based on the character of modern industrial civilization, whose features are complexity and dominance of the machine; and since England is preëminently the type of the modern industrial country, this art will be an English art. But it rejects futurism as merely the cinematographic representation of a series of impressions; and joins the modern movement as a whole in basing itself on tradition, and claiming that the artist's work is not to copy nature, but to create new realities. Every phase of emotion has its appropriate means of expression in some particular form of some particular material, whose appeal is direct and not by association or allegory. These forms take shape and proceed out of the artist's "vortex" (hence the name of the movement), which is a general conception of relations in the universe through which ideas pass and take concrete shape, just as the general equation of a circle in analytical geometry becomes one particular circle when definite quantities are substituted for the algebraic symbol. In 1920 the vorticist movement issued in a secession from the London group to form the X group. But though mainly composed of vorticists, its first exhibition showed some modification if not in doctrine, yet in practice. The earlier vorticist work was geometric and abstract, and owed much to cubism. Hamilton still represented this phase in 1921; but others had turned in the direction of expressing the structure and essential character of natural forms in the way exemplified by the work of Wyndham Lewis. Much of the interest of the earlier vorticist painting lies in disentangling in sequence the elements from which it is constructed; and to this extent it is descriptive and literary. Otherwise, though sometimes showing new and interesting combinations of shapes and colours, it presents only a barren world of geometrical forms.

Modern German Painting.—In Germany the modern movement has been mainly inspired by that side of modern French art represented by Matisse and Derain. Cubism has not gained a real footing there; though the Russian Jew, Marc Chagall, shows cubist influence in the sharply defined planes and angular design of his fantastic, vividly coloured, decorations; and Lyonel Feininger has adopted the cubist method of extension and development of planes. Arbitrary distortion and writhing arabesque are more congenial means of expression in an art always tending towards the romantic and symbolic; native influences, such as Hans von Marées and the Munich decorative school, joined to the study of El Greco and Matthias Grünewald, have paved the way for an expressionist art in the fullest sense of the term—one which has vent to every kind of emotion with unrestrained and brutal licence. A mystical temper and a mass of confused aspirations induced by the war have stimulated this development; but the movement was in being before the war, chiefly under the leadership of Wassily Kandinsky (b. 1866, at Moscow), a prominent member of the Munich group of painters, poets and musicians, whose aim was the expression through art of the "innerer Klang"

—the soul of nature and humanity. According to Kandinsky, colour and form have the power of producing spiritual vibrations quite apart from their ordinary meaning and associations; and a picture consists of an arrangement of form and colour whose spiritual values are in harmony, and unite to express the artist's spiritual conceptions. Thus painting ceases to have representation as its purpose, and becomes analogous to music in its rhythmic arrangements of forms and colours. These may be borrowed from nature, but must have no external associations and may be freely adapted and distorted to suit the artist's aim. Thus Kandinsky has points of contact both with the symbolists and cubists; but he criticizes the latter for reducing the construction of a picture to rules and formulas, and for paying over-much attention merely to representing three-dimensional form. Kandinsky's own work has become increasingly abstract in character and consists of some early flat decorations, combining Russian and Munich influences; a group of more or less direct impressions of nature, inspired by Matisse; "improvisations" which represent spontaneous expressions of inner character; and "compositions" which express a slowly formed and mature spiritual feeling. His most important disciple is Franz Marc (1880-1916), whose animal compositions boldly designed in arbitrary colour are his most typical work. Less abstract but more brutal is a group which has come into special prominence during and after the war. Most prominent of these is Oskar Kokoschka (b. 1886, in Austria), whose early work showed the free distortion, sharp contrasts of light and shade, bold contours, and thick impasto worked into arabesques, by which he conveys his excited and very personal vision. In his later work emphasis by these means is even more emphatic and merciless. The heads of his figures are balanced on tiny bodies, bizarre monsters are introduced, and the paint is literally thrown on the canvas, with great channels made therein to mark the dominant lines of the design. Painters of similar tendencies are Emil Nolde, Karl Hofer, and Karl Schmidt-Rottluff. The last, under the influence of negro sculpture, has become a coarser Matisse. The influence of an earlier generation of Frenchmen is seen in Max Pechstein, whose work owes much to Gauguin, and in Albert Werszgerber and Carl Caspar, both of whom base their design and use of colour on Cézanne. Edward Munch (b. 1862, in Norway) stands somewhat apart in his combination of realism, fantasy and power of monumental design derived from Manet, Toulouse-Lautrec and Seurat, which excited violent controversy in Berlin when first exhibited, and led to the split in the Kunstverein there which marks the rise of the modern movement.

Modern Russian Painting.—In Russia the influence of French art has been no less marked than elsewhere, but has taken peculiar and characteristic shape. Towards the end of the 19th century Western and in particular French influence was represented by the realistic historical painters such as Ilya and Repin and a group of *plein-air* landscape painters. In reaction against their naturalism a decorative school developed, corresponding somewhat to the English Pre-Raphaelites, basing its work on old Russian art, and represented by Vassily Surikov (1848-1916) and Victor Vasnetsov. Of this reaction the modern movement is really a development. One form it has taken is represented by Mikhail Vrubel (d. 1910), whose mystical symbolism recalls that of Gustave Moreau in its search to express things of the spirit in pictorial form; while Petroff-Wodkin is nearer to the French fauves in his simplified and distorted nudes and arbitrary use of colour. More important is a Petrograd group, consisting of historical painters whose aim is to reconstruct in decorative form a past epoch, not from living models dressed in costume of the period, but from the close study of every form of contemporary record. Thus, the movement is primarily intellectual and literary and has produced an art which, for all its refinement and delicacy, is inclined to be precious and a mere *réchauffé* of already-used material. Within the movement one group looks to the West. Alexander Benois has concentrated on the age of Louis XIV.; Konstantine Somov, the most charming and individual of all, upon the period of 1830; and Eugène Lanceray upon the court of Elizabeth and Peter the Great. Stelletsky and Count Koma-

rovsky, on the other hand, have gone to old Russia for their motives. Stelletsky is the purist of the group, his reconstructions of Russian mediaeval life being based upon minute archaeological study of ikons, service books and similar sources. Nicolas Roerich has departed from strictly documentary methods in seeking to reconstruct primeval and prehistoric Russia in his fantastic flat decorations based on Russian legends, and thereby joins hands with the group represented by Vasnetzov. Rather apart is Boris Anrep (working in 1921 in England), who studied Byzantine art and the ikon, not in an archaeological spirit, but as exemplifying a means for the expression of human emotion. His work is principally in mosaic, submission to whose limitations, he holds, makes for the simplicity and directness which are often lost amid the technical possibilities of oil paint. The close connexion of modern Russian art with the theatre is another important characteristic, which has grown directly out of the decorative reaction against realism. Leon Bakst represents one side of this. Originally associated with the Petrograd historical group, he came into touch with Serge Diaghilev and became one of the chief designers of settings for the Russian Ballet. His use of line and colour relates him to the East; but, like Benois and Somov, his outlook and method are those of the West. Distinct in character is the art of Nathali Gontcharova and M. Larionov. Using the methods of the Petrograd group, they took their material from Russian peasant art, as represented in the decoration of articles in daily use and in the "lubok," the Russian equivalent of the "images d'Épinal," which gives their earlier work notable simplicity and directness. The West was not to be denied, however, and Gontcharova's setting for the 1914 production of the "Coq d'Or" and Larionov's "Les Contes Russes" of 1915 mark the invasion of the theatre by cubist ideas. The colour scheme was still that of Russian peasant art; but the design was based on abstract forms, and aimed at a rhythm in harmony with the music and the dances. To this development the name of *rayonnisme* has been given.

Much of the criticism levelled at the modern movement, like that once directed against impressionism, is merely a violent statement of personal preference. Weightier arguments point out that the emphasis given in the modern movement to the third dimension merely exalts one element in natural appearance, and urge that ultimately design must be based on the play of contour and shapes on the picture plane. Also, it is said, modern methods of simplification and distortion tend to become formulas which prevent sincere and spontaneous expression no less than older conventions. But contention chiefly centres round the question of representation. It is argued that a purely abstract art, which takes no account of the ideas and emotions conveyed by the objects represented, is a limited and empty affair. Rhythm in the plastic arts, no less than in literature, must emphasize some meaning; and form takes on a significance by association, if not with specific objects, yet with general ideas of mass, space and movement.

UNITED STATES.—Between 1910 and 1921 many of the painters mentioned in the earlier article (20.518) had passed away, and some of their younger contemporaries had also laid down their brushes: Ryder, Bunce, Blakelock, Duveneck, Alexander, Smedley, Millet, Cox, Beckwith, Alden Weir. Abbey, who died in 1911, left no followers, but La Farge and Chase wielded great influence over a host of pupils. With the development of American art-schools and the increasing number of capable instructors, the trend towards European art-centres had by 1921 grown less. There was already promise of a school with distinctly American characteristics. This was to be seen most clearly among the painters of landscape. Twachtman and Robinson, among the older men who were trained abroad, brought back some of the light of

the so-called Impressionist School, and their example in raising the colour-pitch was of great benefit. Crane, a pupil of Wyant, and such men as Tryon, Murphy and Ben Foster, ably carried on the tradition they received from their American masters. Dewing, Metcalf and Childe Hassam developed individual ways of looking at their subjects. Carlsen, Dougherty and Waugh found the sea an ever-changing theme for their brushes, and they produced canvases not behind those of the landscape men.

With the passing of the Society of American Artists, the men who made this organization a force were merged with the members of the older National Academy and became conservatives in their turn. Thayer, Brush, Blashfield, Tarbell, Mowbray, Melchers and Simmons were still in 1920 painting pictures which showed their sound technical training and their artistic point of view. Some of the later men who developed original ways of doing things were Robert Henri, Jonas Lie, William Glackens, Rockwell Kent, John Sloane, George B. Luks, C. C. Cooper, A. B. Davies, Jerome Myers, George Bellows, Gardner Symons, Everett Shinn, W. E. Schofield and Randall Davey. Abundant manifestations of vorticism and cubism came to be seen in American painting. The followers of Cézanne, Matisse, Gauguin, Van Gogh and Picasso were many, but chiefly the younger men whose work was still in the experimental stage. There was a steady advance in mural painting. Sargent added to the decorations for the Boston Public Library, and the example set there and elsewhere was followed in many of the larger cities, in state capitols, municipal courts, churches and theatres. Pittsburgh, Harrisburg, Baltimore, St. Paul and Minneapolis have important buildings decorated by such mural painters as La Farge, Blashfield, Alexander, and others. There has been remarkable growth at the art museums, especially at the Metropolitan Museum of New York, the Boston Museum of Fine Arts, the Carnegie Institute of Pittsburgh (whose international exhibitions draw many exhibits from overseas), and the Chicago Art Institute. No less remarkable has been the formation of important collections in cities whose size would often afford no reason for expecting their presence. Worcester, Providence, Cleveland and Minneapolis have excellent museums. Washington now possesses three collections of paintings—the Corcoran Gallery, the National Gallery and the Freer Collection. Moreover, private collections of importance have increased in number and quality, and native artists are often given there the high place they deserve. Some of the universities offer courses in the History of Art and in the elements of design. In time this should produce a body of intelligent criticism which should still further stimulate artistic effort in America. (J. C. VAN D.)

PALAEOLOGY (see 20.579).—During the period 1910-21 the science of extinct forms of life made remarkable progress, especially in North America, where explorations and studies were less interrupted by the World War. The contact of palaeontology with other sciences—even those apparently remote like astronomy, physics and chemistry, less remote like comparative anatomy, or very intimate like geology—was one of the outstanding features of the synthetic work accomplished. Of transcendent interest, however, was the contact between mammalian palaeontology and anthropology, especially through the researches of William K. Gregory of the American Museum of Natural History, and also of G. Elliot Smith of London University to whom is due the article on ANTHROPOLOGY in these New Volumes.

Principal Synthetic Works of 1910-21.—Chief among the synthetic works in pure palaeontology are those of the Austrian palaeontologist Othenio Abel, *Grundsätze der Paläobiologie der Wirbeltiere* (1912), *Die Stämme der Wirbeltiere* (1919), and *Lehrbuch der Paläozoologie* (1920), which give masterly reviews of the whole fossil history of the vertebrates, especially in analogous and convergent adaptation. In invertebrate palaeontology the reader is referred to Amadeus Grabau's *Principles of Stratigraphy* (1913) and *Textbook of Geology* (1920-1), in which are summed up the principles derived from the teachings of Waagen and Neumayr in Germany, of Hyatt and Beecher in America, in pure palaeontology and in application to geology. A broad synthetic treatment of climate and time in relation to the evolution of life is that of the late Joseph Barrell (1917) in his *Rhythms and the Measurements of Geologic Time*. The best

synthetic treatment of climate, time and geologic change in relation to the geologic origin and the migration of the different vertebrate groups in William Diller Matthew's *Climate and Evolution* (1915). The subdivisions of geologic time and the successions of faunas and climates are broadly reviewed in the *Textbook of Geology* by Louis V. Pirsson and Charles Schuchert (1915; revised edition, vol. 1, 1921). The latest summary of the geology, past physiography and palaeontology of the world is found in the French edition of the great work of Eduard Suess, *Das Antlitz der Erde*, translated and annotated by Emmanuel de Margerie as *La Face de la Terre* (1902, 1918). The comparative evolution of the mammalia of the eastern hemisphere and of North America is broadly treated in Henry Fairfield Osborn's *Age of Mammals* (1910); while the mammals of North and South America are compared in W. B. Scott's *History of Land Mammals in the Western Hemisphere* (1913). A broad treatment of the whole subject of invertebrate and vertebrate evolution is given in Richard S. Lull's *Organic Evolution* (1917) and a synthetic review of the earth's history, from its solar beginnings to the Age of Man, in Osborn's *Origin and Evolution of Life*.

Life Epochs of Geologic Time.—The time scale in the accompanying table is taken from the work of Pirsson and Schuchert of 1915, modified by the substitution of geologic time units for years. There is a growing indisposition to reckon past time in terms of years, and a growing tendency to substitute a relative term like *time units*, because of the enormously wide discrepancy between the older estimates of geologists, based on sedimentation and the thickness of the various assemblages of rocks, which, taken together, make up the whole geologic time scale, and the estimates of physicists, based on the slow liberation of radium from radioactive minerals. The radium estimates of the age of the earth range as high as 1,400,000,000 years for the oldest known rocks, according to Barrell, who has adopted the calculations of Rutherford and others based on the "rate of disintegration" of radioactive minerals. The contrast between the two methods is exemplified in the following table:

	Walcott (1893) Years	Barrell (1917) Years
Age of Man and of Mammals—Cenozoic	3,000,000	55,000,000–65,000,000
Age of Reptiles—Mesozoic	9,000,000	140,000,000–180,000,000
Age of Amphibians, Fishes, Invertebrates—Palaeozoic	18,000,000	360,000,000–540,000,000
Precambrian Time—Evolution of Invertebrates and of Unicellular Life	30,000,000	600,000,000–800,000,000
Minimum Total	60,000,000 (Geikie, 1899)	1,200,000,000
Maximum Total	400,000,000 (Geikie, 1899)	1,400,000,000

The most original part of Barrell's contribution was the measurement of time from the base of the Palaeozoic to Recent time by new palaeophysiological methods, taking into account particularly the rhythms or cycles of dry and moist climates and of elevations and depressions, theories which were originally interpreted by T. C. Chamberlin and popularly treated by Ellsworth Huntington, the physiographer of Yale University.

A few decades ago the physicists and mathematicians, especially Kelvin and Tait, insisted that the earth could not be more than 10,000,000 to 20,000,000 years old; now the physicists are extending the age of the life period to 1,400,000,000 years, as estimated by Barrell (1917). The most recent determination by physicists, as reviewed by Lord Rayleigh (1921), takes into consideration the transmutation of chemical elements, for example, in the bröggerite of the Precambrian rocks at Moss, Norway: "Taking the lead as all produced by uranium at the rate above given, we get an age of 925 million years. Some minerals from other archæan rocks in Norway give a rather longer age. . . The helium method is applicable in some cases to materials found in the younger formations, and proves that the ages even of these are to be reckoned in millions of years. Thus the helium in an Eocene iron ore indicated 30,000,000 years at least. . . The upshot is that radioactive methods of research indicate a moderate multiple of 1,000 million years as the duration of the earth's crust as suitable for the habitation of living beings, and that no other considerations from the side of pure physics or astronomy afford any definite presumption against this estimate." Applying this estimate to the evolution of a familiar mammal like the horse, it might be said that the four-toed horse (*Eohippus*) existed 30,000,000 years ago, a somewhat larger estimate of the life period of the horse than that demanded

by palaeontologists. In the same discussion W. J. Sollas comments on the expansion of time-estimates proposed by physicists: "The age of the earth was thus increased from a mere score of millions to a thousand millions and more, and the geologist who had before been bankrupt in time now found himself suddenly transformed into a capitalist with more millions in the bank than he knew how to dispose of."

In this connexion we may recall the fact that as early as 1859 Charles Darwin pointed out that the high degree of evolution and specialization seen in the invertebrate fossils at the base of the Palaeozoic, namely, the Cambrian, proved that Precambrian evolution occupied a period as long as, or even longer than, that of Cambrian to Recent time (see Table I on p. 11). Poulton, the leading disciple of Darwin in England (1896), declared that 400,000,000 years was none too long for the whole life evolution period; this would allow 200,000,000 years for Precambrian time and another 200,000,000 years from Cambrian to Recent time.

Walcott's Revelation of Precambrian and Cambrian Life.—Charles D. Walcott (1899, 1914) has discovered the remains of life in the Precambrian (Proterozoic) rocks of North America and has been able to give us a fragmentary picture of the fauna and flora of that very ancient period. In Montana at a depth of nearly 10,000 ft. below the earliest Palaeozoic rocks (Cambrian) he found evidence of ancient reef deposits of calcareous algae, which ranged upward through 2,000 ft. of strata. Above these reefs are 3,000 ft. of shales containing worm trails and the fragmentary remains of large crustacean-like organisms. From rocks of approximately the same age in Ontario, Canada, he has described sponge-like forms (*Atikokania*) which are of such generalized structure that it is difficult to decide whether they should be regarded as sponges or as archaic corals. These few plant and animal remains are all that are known from remotely metamor-

phosed rocks of Precambrian time, but the existence of annelids and possible arthropods marks a break into the hitherto unknown Precambrian. Walcott's most surprising discovery in Precambrian time is a monad or bacterium attributed to *Micrococcus* sp. indet. from the Algonkian of Montana, but probably related rather to the existing *Nitrosomonas*, one of the prototrophic or primitive-feeding bacteria, which derives its nitrogen from ammonium salts.

In 1910 Walcott discovered in the Cambrian (Burgess) shales of Alberta, Canada, a marvellously rich fauna whose preservation is so perfect that the setae of the worms, the jointed appendages of the trilobites, the impressions of soft-bodied medusae and holothurians, and even the alimentary tract and stomach of certain of the crustaceans can be seen on the shale surfaces almost as clearly as in living forms (Plate I.). This discovery fairly revolutionizes our knowledge of the anatomy of the delicately organized as well as the chitinous-armoured forms, like the trilobites. Including the new forms contained within these Albertan shales, the Cambrian marine fauna is now known to be far more abundant than even imagined by Darwin, comprising some 1,500 species, 1,200 of which occur in North America. From Lower as well as Middle Cambrian (Burgess) faunas, it appears that the Precambrian invertebrates had probably become completely adapted to all the life zones of the continental and oceanic waters, excepting possibly the abyssal. All the principal phyla—the jointed arthropods (including the trilobites among the crustaceans and the merostomes among the arachnids), segmented worms (Annelida), echinoderms, molluscs (including pelecypods, gastropods and primitive cephalopods), brachiopods, medusae and other coelenterates, and sponges—were presumably established in Precambrian times.

TABLE I. Life Epochs and Geologic Time Units of Europe and North America (After Pirsson and Schuchert, 1915; issued by Osborn in 1918)

The Cambrian fauna has been made known to us in large measure through the field discoveries and monographic studies of Philip Lake (1906) for Great Britain, of Walcott (1909-21) for North America, and of Cowper Reed (1915) for India. The great variety and high specialization of the Cambrian marine forms, including representatives of all the known marine invertebrate phyla, is in harmony with the trend of discovery among the vertebrates, which is to put the origin of existing families very far back into the Age of Mammals and even into the Age of Reptiles (Mesozoic). In fact, the antiquity and persistence of modern types, as distinguished from modern genera and species, is an illustration of a very far-reaching principle, namely, that the most stable form of energy in matter known is that of the heredity chromatin on which this extraordinary preservation of the main features of the ancestral type depends. Next to the stability of the properties of the chemical elements, which are now known to pass into each other by transmutation, the most stable physicochemical properties are those which form the heredity basis of life.

Freshwater and Terrestrial Origins.—The eurypterids appear as contemporaries of the Cambrian trilobites and traces of them are found in Precambrian rocks; they attain to their acme in Silurian time and develop into the eight-foot giants of the fauna of the Devonian of Scotland and eastern North America, suffering extinction at the close of the Palaeozoic. In 1916 appeared Marjorie O'Connell's memoir, entitled *The Habitat of the Eurypterida*, giving as the summation of her studies that throughout their entire phylogenetic history the eurypterids lived in the rivers, a conclusion accepted in the main by Schuchert (1916), with the modification that they also appeared to have lived at times in the brackish waters of more or less large bays and possibly in limited numbers even in the seas. Many other origins formerly traced to the sea have more recently been traced to fresh water. T. C. Chamberlin (1900) proposed the hypothesis of a prevailing freshwater origin both for the ancestral backboneed animals known as chordates as well as for the much more ancient arthropods, the eurypterids. His strong influence was needed to overcome the widespread notion that all forms of life originated in the sea; and, one after another, theories of freshwater and terrestrial origin have replaced the theory of marine origin. Early in 1916 Barrell pointed out the influence of Silurian-Devonian climates on the rise of air-breathing vertebrates and freshwater origin in Devonian time under seasonal rainfall.

Schuchert continues that the probable freshwater life of the eurypterids opens a vista into continental life as far back as the Upper Cambrian. Other merostomes related to the eurypterids radiated out from the fluvial faunas of Cambrian, Ordovician and Silurian time, while in the Devonian rivers dwelt great spider-like eurypterids together with forms so similar to scorpions that they might be called river scorpions, and others that were active swimmers. O'Connell's argument regarding the freshwater eurypterids applies equally to *Limulus*, the horseshoe crab. In brief, the existence of freshwater faunas no less varied than the marine faunas is beginning to be traced back to Lower Cambrian time. O'Connell shows that the entire phylogeny of the eurypterids, which includes about 160 species from the Precambrian to the end of the Palaeozoic, distributed in 78 geologic horizons throughout the world, points to migrations like those of fishes from the headwaters of interlacing river systems, and, taken with other evidence, strongly supports the theory of Predevonian river life as opposed to the general assumption of marine life of all early faunas.

It now appears that beginning in Precambrian time the trilobites, by wide adaptive radiation, reached the acme of their development in the Cambrian, displaying a high degree of articulation and specialization of appendages, suffered a marked decline after the Silurian, and became extinct at the end of the Palaeozoic. James Perrin Smith, who has made a very exhaustive analysis of cephalopod evolution and especially of the Triassic ammonites, observes that the evolution of form continues uninterruptedly even where there is no evidence whatever of environmental change.

Principal Literature, Cambrian to Pleistocene.—A few of the major contributions to our knowledge of the life of the Palaeozoic are: *Cambrian Geology and Palaeontology* (1910) and *Cambrian Brachiopoda* (1912) by Charles D. Walcott; *Cambrian Fossils of Spiti* (1915) and other papers on the Palaeozoic of India by Cowper Reed; *A Monograph of British Cambrian Trilobites* (1906) by Philip Lake, and *A Monograph of British Graptolites* (1901) by Gertrude Elles and Ethel Wood. The foraminifera have been treated by E. Schellwien, *Monographie der Fusulinen* (1908-12); the bryozoa by R. S. Bassler, *Early Paleozoic Bryozoa of the Baltic Provinces* (1911) and G. W. Lee, *British Carboniferous Trepostomata* (1912); the echinoderms by R. T. Jackson in his memoir on the *Phylogeny of the Echini with a Revision of Palaeozoic Species* (1912), and by Frank Springer in his monograph *Crinoida Flexibilia* (1920) and in numerous shorter contributions. The ancient arthropods, including, besides the trilobites, merostomes and other arachnids and also insects, have been described by J. M. Clarke and R. Ruedemann in their memoir on *The Eurypterida of New York* (1912), by Alexander Petrunkevitch, *A Monograph of the Terrestrial Palaeozoic Arachnida of North America* (1913), by R. I. Pocock, *A Monograph of the Terrestrial Carboniferous Arachnida of Great Britain* (1911), and by F. Meunier, *Nouvelles recherches sur quelques insectes du terrain houiller de Commeny* (Allier) (1906-12). The literature on the Mesozoic contains more references to ammonites than to other groups, because of their abundance and palaeontological importance. The ammonite faunas of the Triassic have been described by James P. Smith, *The Middle Triassic Marine Invertebrate Faunas of North America* (1914) and by Carl Diener, *The Trias of the Himalayas* (1912), *Japanische Triasfauna* (1915), and other papers on the Triassic of the Himalayas and southern Europe (1915).

For the Jurassic there are the classic volumes by S. S. Buckman, *Yorkshire Type Ammonites* (1909-19) continued in the *Type Ammonites* (1920) and the memoir by C. Burckhardt, *Faunes Jurassiques et Crétacées de San Pedro del Gallo* (1912) for Mexico. The studies on Cretaceous ammonites have been more local in character and include: E. Stolley's *Beiträge zur Kenntnis der Cephalopoden der norddeutschen unteren Kreide* (1911-2), D. N. Sokolov's *Zur Ammoniten Fauna des Petschoraschen Jura* (Russian) (1912), H. Yabe and S. Shimizu's, *Notes on Some Cretaceous Ammonites from Japan and California* (1921), and numerous papers by A. de Grossouvre, W. Kilian and E. Haug for France and the Mediterranean region. The silicious sponges which are so well represented in the Mesozoic have received the most careful microscopic study by the students and followers of Zittel. Pioneer work was done in England by the late George Jennings Hinde, *A Monograph of the British Fossil Sponges* (1887-1912), and this work was followed in Germany by A. Schrammen's *Kiesel-spongien der oberen Kreide von Nordwestdeutschland* (1910) and R. Kolb's *Die Kiesel-spongien des schwäbischen weissen Jura* (1911). Special works on other groups are: *A Monograph of the Cretaceous Lamellibranchia of England* (1899-1912) by Henry Woods, *Synopsis des Spirobranches (Brachiopodes) Jurassiques Cello-Souabes* (1915-9) by the Swiss palaeontologist Louis Rollier, and Clarke and Twitchell's *The Mesozoic and Cenozoic Echinodermata of the United States* (1915). Among the major contributions to Mesozoic stratigraphy and entire faunas or floras may be mentioned: Victor Uhlig's *The Fauna of the Spiti Shales* (1903), Carl Renz's *Die mesozoischen Faunen Griechenlands* (1911), G. R. Wieland's *American Fossil Cycads* (1906-16), and E. W. Berry's *The Upper Cretaceous Floras of the World* (1916).

For the Tertiary life especial reference should be made to the contributions on different groups made by Thomas Wayland Vaughan (corals), E. W. Berry (plants), J. A. Cushman (foraminifera), R. T. Jackson (echinoderms), Mary Rathbun (crustaceans), A. Pillsbury (cirripedia), and others in *Contributions to the Geology and Palaeontology of the Canal Zone, Panama, and Geologically Related Areas in Central America and the West Indies* (1919). The bryozoa have been carefully described and beautifully illustrated by Ferdinand Canu and Ray S. Bassler, *North American Early Tertiary Bryozoa* (1920), while the foraminifera have been described in equal detail by Joseph A. Cushman in numerous contributions, and by H. Yabe (1921) and H. Douville (1911). For other groups we may note: J. Lambert's *Description des Echinides des terrains néogènes du bassin du Rhône* (1911-6), F. W. Harmer's *The Pliocene Mollusca* (1914-20), and papers by W. H. Dall on the mollusca. A general résumé of the Pleistocene vertebrate and invertebrate life is embodied in F. C. Baker's *The Life of the Pleistocene or Glacial Period* (1920). Stimulating general reviews of the progress of invertebrate palaeontology are the presidential addresses by F. A. Bathor, *Fossils and Life*, British Association (1920), by Ruedemann, *The Palaeontology of Arrested Evolution* (1916), and by Clarke, *The Philosophy of Geology and the Order of the State* (1917).

PROGRESS IN VERTEBRATE PALAEONTOLOGY

Announced: Advent of the Fourth Generation.—The principal feature of the decade has been the advent of a new generation of workers in vertebrate palaeontology who, in a sense, constitute a fourth or "20th century" group. Beginning with Cuvier (1769-1832) as founder of the science and leader

of the first group, the second group embraced the British anatomists Richard Owen (1804-1892) and Thomas Henry Huxley (1825-1895), the French leader Albert Gaudry (1827-1908), the Swiss palaeontologist Ludwig Rütimeyer (1825-1895), and the three great Americans, namely, Joseph Leidy (1823-1891), Edward Drinker Cope (1840-1897), and Othniel C. Marsh (1831-1899). These men marshalled the first positive proofs of vertebrate evolution in Europe and America; they worked more or less independently as pioneers and laid the entire foundation of the modern classification of the Vertebrata. The leader of the third group was the Russian, Waldemar Kowalevsky (1842-1883), who instituted intensive investigation of mechanical adaptation in relation to natural selection. Still productive members of the same period are Arthur Smith Woodward (b. 1864) and Charles W. Andrews (b. 1866) in England, Marcellin Boule (b. 1861) and Charles Depéret (b. 1854) in France, Louis Dollo (b. 1857) in Belgium, Max Schlosser in Germany, Giovanni Capellini (1833-) in Italy, and in America William B. Scott (b. 1858) and Henry Fairfield Osborn (b. 1857). This group includes also Samuel Wendell Williston recently deceased (1852-1918), and Ramsay H. Traquair (1840-1912). Scott treated chiefly mammals, Williston chiefly reptiles and amphibians, Osborn both mammals and reptiles. The principal accomplishment of this third school has been (1) to conduct world-wide exploration, (2) to correct, co-ordinate and firmly establish the great classifications proposed by the second school and (3) to fill out the details and principles of phylogeny or lines of reptilian, avian and mammalian descent. The leading explorer of this period was John Bell Hatcher (1861-1904), who brought together a large part of the materials for two great monographs of the United States Geological Survey, Osborn's *Titanotheres* and the Hatcher-Lull *Ceratopsia*; he also made the wonderful collection of South American fossils which forms the basis of Scott's monumental memoirs of the Princeton University Expeditions to Patagonia during the years 1896-9. Osborn's monograph *The Titanotheres* (an Eocene-Oligocene family of mammals), twenty-one years in preparation, has been completed but not published; others of his memoirs are the *Equidae of the Oligocene, Miocene, and Pliocene of North America* (1918) and *Camarasaurus, Amphicoelias, and other Sauropods of Cope* (1921). Williston's monographs are chiefly on the Cretaceous mosasaurs and the archaic Reptilia of the Perm-Trias, to which he made most notable contributions. Of this period were Florentino Ameghino (1854-1911), the distinguished vertebrate palaeontologist of Argentina, and Eberhard Fraas (1862-1913) of Stuttgart. Oliver P. Hay (b. 1846) is also of this group, author of the monograph of the *Fossil Turtles of North America* (1908) and of the invaluable *Bibliography and Catalogue of the Fossil Vertebrata of North America* (1902).

To the fourth group of vertebrate palaeontologists belongs the school trained by Professor Osborn in the American Museum of Natural History, of which the senior is William Diller Matthew (b. 1871), Walter Granger (b. 1872), Barnum Brown (b. 1873), William K. Gregory (b. 1876), Richard S. Lull (b. 1867), of Yale University, Lawrence M. Lambe (1863-1919), late of the Canadian Survey, and C. Forster-Cooper, Cambridge University. The chief intensive work of Matthew and Granger has been on the American Eocene mammalian faunas and in aiding Osborn to establish sixteen Eocene-Oligocene life zones of North America very closely co-ordinated with corresponding life zones of western Europe. Brown's explorations have added greatly to our knowledge of Cretaceous dinosaurs. Of the same group are the pupils of Williston, of whom the leader is Ermine C. Case (b. 1871), who has contributed treatises on Permian life. At the same time John C. Merriam (b. 1869) has led explorations on the Pacific coast of America and inspired a school of younger workers both in vertebrate and invertebrate palaeontology. In Great Britain D. M. S. Watson (b. 1886) has taken up the work of Owen and Huxley in primary groups of fishes, amphibians and reptiles; in Austria Othenio Abel, a pupil of Dollo, is the great exponent of vertebrate evolution; in Germany Friedrich von Huene and Ferdinand Broili are leaders in sauropsidan palaeontology, other notable palaeontologists of recent years being Franz Dre-

Notable vertebrate fossils, complete remains of which have been discovered during the last decade. The mounts from which the photographs were taken are in the American Museum of Natural History, New York. (Illustrations reproduced by permission of the President of the American Museum of Natural History.)
 FIG. 1.—*Deinodon* or *Gorgosaurus*, a mid-Cretaceous carnivorous dinosaur from Alberta, Canada, mounted in running position.
 FIG. 2.—*Struthiomimus*, the "ostrich mimic," a mid-Cretaceous toothless offshoot from the carnivorous dinosaur stock. Fig. 2 shows the complete

skeleton in *rigor mortis*, while fig. 2a represents the same, skeleton partly restored from fig. 2.

FIG. 3.—*Dialryma*, a gigantic mollusc-eating bird, from the Lower Eocene of Wyoming.

FIG. 4.—*Moropus*, an okapi-like herbivore, from the Lower Miocene of Dakota, related to the chalicotheres of Europe and Asia.

FIG. 5.—*Plihippus*, direct one-toed ancestor of the modern horse, from the Lower Pliocene of Nebraska.

FIG. 6.—*Trilophodon*, direct descendant of *Mastodon angustidens* of Europe and North Africa, Lower Pliocene of northern Texas.

All the figures are on the same scale.

vermann, Ernst Strömer (b. 1871) and Otto Jaekel (b. 1863). At Upsala in Sweden Carl Wiman has inspired a remarkably progressive group of workers, while in Switzerland Hans Georg Stehlin (b. 1870) has continued in the great field of Rüttimeyer.

For the principal contributions by palaeontologists of the third and fourth groups above described, the reader is referred to the Memoirs and Bulletins of the American Museum of Natural History, of the university of California, of the Carnegie Institution of Washington, to the Contributions from the Palaeontological Laboratory (Peabody Museum) of Yale University, to the Memoirs and Catalogues of the British Museum (Natural History), to the Palaeontographica, and to the Memoirs of the Société Paléontologique Suisse. It is upon the researches of these workers in field and laboratory that the great synthetic volumes referred to earlier are chiefly founded, and that the following generalizations of modern vertebrate palaeontology are chiefly due.

ORIGINS OF THE GREAT VERTEBRATE STOCK AND ITS BRANCHES

Origin of Chordates.—No discovery has thus far lessened the gap between the modern Protochordates (*Amphioxus*, tunicates, etc.) and any of the known phyla of invertebrates. Some of the cephalaspis ostracoderms have been cited by Patten as favouring the view that the chordates have been derived from certain arthropods, but such resemblances are ascribed to convergence by Dollo and many others. The earliest ostracoderm remnant actually known is a dermal plate of a genus named *Astraspis* from the Upper Ordovician near Canyon City, Colorado; this represents a new family Astraspididae allied to the Psammosteidae of the Silurian and Devonian (C. R. Eastman, 1917). These chordates, heavily shielded and hence known as *ostracoderms*, were dominant in the Upper Silurian, radiating into six families and many genera, abundant in the Lower Devonian, diminishing in the Middle Devonian and becoming extinct in the Upper Devonian.

Origin of Fishes.—The earliest fish remnant actually known is the fin-spined *Onchus* from the Upper Silurian of Scotland, which appears to represent the group of acanthodian sharks, covered with fine quadrate scales like those of ganoids and with a skull structure distinctly elasmobranch. The elasmobranchs (shark and ray types) are still the oldest known gnathostomes or true jaw-bearing vertebrates, constituting (a) one of the four primary gnathostome groups, i.e. jawed groups, the others being (b) the fringe-finned ganoids (Crossopterygii), (c) the ray-finned ganoids and teleosts collectively known as Actinopterygii and (d) the lungfishes (Dipnoi). The fossil ancestors of the fringe-finned ganoids have not yet been discovered; so these animals are theoretically traced to unknown cartilaginous fishes of Silurian times. The oldest Crossopterygian actually known is the *Osteolepis macrolepidotus* of the Middle Old Red Sandstone of Scotland. There were two principal periods of adaptive radiation among the Crossopterygii, the first in Middle and Upper Devonian times, the second in Mesozoic times which produced the family Coelacanthidae, from which may have sprung the existing fishes *Polypterus* and *Calamoichthys* as degenerate offshoots. From the earlier Devonian radiation of the Crossopterygians is traced the theoretic origin of the Dipnoi or lungfishes, on the one hand, and of the oldest known amphibians on the other. The Devonian Crossopterygian skull and fins appear to be "archetypal," to the lungfish type, on the one hand, and to the amphibian type on the other. Cope's genius in separating the Actinopterygii is sustained, for there is as yet no fossil evidence of the connexion of this group with the Crossopterygii, other than the supposed community of origin in Silurian times. Here the reader should consult the writings of Smith Woodward, Joseph F. Whiteaves, Bashford Dean, William K. Gregory and the synthetic reviews of Osborn (1918) and Lull (1917).

Origin of Amphibians and First Tetrapods.—In this epoch-making transition from the fringe-finned fish type to the tetrapodal amphibian and terrestrial type, the prophecies of Huxley, Cope and Baur and other great anatomists of the second and third groups of palaeontologists appear to be fulfilled. The Silurian period marked the parting of the ways among the great

primary groups of fishes and the first steps towards the frame of the terrestrial amphibians. Not until the Upper Devonian of Pennsylvania do we find a footprint (*Thrinacosaurus* Marsh) which may be referred to an amphibian tetrapod. The first known actual skeletons occurred in the Coal Measures (Upper Carboniferous) of Europe and America and represented four widely radiating groups. The structural gap separating the earliest tetrapod amphibians and fishes is perhaps the greatest known in the whole range of vertebrate evolution, but all modern authorities agree that the amphibians were probably derived from a Silurian or early Devonian type of fringe-finned fish. Even as far back as the Upper Carboniferous and even in the Lower Carboniferous the Amphibia were adaptively radiating into several orders and numerous families comprising highly specialized forms. During the Carboniferous we find numerous independent phyla of eel-like or burrowing, and of compressed, swimming, as well as of large-bodied, predatory forms. The latter culminate in the gigantic labyrinthodonts of the Triassic. The exact connexion of any of these forms with the modern Amphibia (urodeles and Anura) is doubtful. The Anura first appear in the Jurassic, and at the present time they retain many characters reminiscent of such Palaeozoic Amphibia as the branchiosaurs and the *Eryops* group. The urodeles are first known in the genus *Hylaobatrachus* of the Lower Cretaceous of Europe. Both groups, especially the Anura, appear to have gone through a wide adaptive radiation during the Tertiary. The connexion of the modern caecilians with the ancient types is obscure. The reader is referred especially to the contributions of Williston, Case, Watson, Gregory, Broili, and the synthetic reviews of Osborn (1918) and Lull (1917).

Origin of Reptiles.—The oldest-known reptiles, solid-headed *Cotylosauria* of Cope, are regarded as amphibians which had eliminated the aquatic stages in development, the oldest reptile actually known being the genus *Eosaurus* from the Coal Measures of Ohio. In other words, the cotylosaur reptiles are traceable to solid-headed stegocephalian amphibians, which, in turn, are traceable to solid-headed unknown Crossopterygians of Silurian times. The oldest and most primitive reptiles (*Cotylosauria*) occurring in the Upper Carboniferous and Permian, are thus structurally very close to certain contemporary stegocephalian amphibians. The first great adaptive radiation of the reptiles into the two grand divisions, the solid-headed (*Cotylosauria*) and the temporal-arched (*Pelycosauria*), began in the Upper Carboniferous and still more widely diverged in Permian times. As early as the Permian, occurs a mammalian-like series of reptiles which exhibits an extensive adaptive radiation and gives off one branch, the *Cynodontia*, which, in turn, survives into Triassic times and clearly approaches the mammalian grade of organization. From the primary temporal-arched also appear the forerunners of the Mesozoic reptiles, the plesiosaurs, ichthyosaurs, dinosaurs and pterosaurs, widely separated from each other in the Triassic and thus having their branches deep down in the Permian and Carboniferous, each grand division giving rise to an adaptive radiation of its own. These have been traced in detail by such authorities as Andrews, Dollo, Abel, von Huene, Williston and Osborn.

Here the reader is referred to the writings of Williston, Hatcher, Osborn, Merriam, Lambe, Lull, and especially during the past decade to those of Charles W. Gilmore of the United States National Museum, Washington, and of Dr. Robert Broom of South Africa, as well as to the synthetic reviews of Osborn (1918) and Lull (1917).

The two greatest achievements of the decade are the clearing up of the relationships of the primitive South African terrestrial Reptilia of the Perm-Trias, beginning with the solid-headed types (pareiasaurs) and ending in their highest expression, the mammal-like types known as *Cynodonts* and *Therapsids*. The field explorations of Robert Broom and the profound comparative researches of D. M. S. Watson and of William K. Gregory have given us a clear comprehension of the habits and relationships of this first terrestrial radiation group. Williston and

Origin of Birds.—Palaeontologists still agree in endorsing Huxley's opinion that birds are "glorified reptiles." The origin of birds, according to recent reviewers such as Osborn and Gregory, brings us close to the two-temporal-arched (*s.e. Diapsida*) reptiles, namely, to the stem which also gave off the dinosaurs, the pterosaurs and the smaller parasuchians (*Euparkoria*). Fossil bird remains are extremely rare. The earliest bird known is the famous *Archaeopteryx* of the Jurassic of Solnhofen, Germany. This is largely a bird, excepting in the tail, the simplicity of the feather arrangement and the possession of teeth. According to the four-winged hypothesis of origin advocated by Beebe, we should some day discover a bird with parachute-like action in both fore and hind limbs. Recent contributions of note on this subject are those of Gerhard Heilmann (1913) and of William Beebe (1915), and the synthetic reviews of Osborn (1918) and Lull (1917).

Origin of Mammals.—Evidence has been accumulating rapidly in favour of the theory that the origin of the mammals should be traced to the more progressive terrestrial mammal-like reptiles (the *Cynodontia*) of the Permian and Triassic of South Africa and Europe, as described in the studies of Broom, Watson, Haughton, Osborn and Gregory. Structurally related to these *Cynodonts* are the so-called *Protodonts* of Osborn, *e.g. Dromatherium* and *Microconodon* of the Triassic of North Carolina. But of equal antiquity are the multituberculates, *e.g. Plagiaulax* and *Microlestes*, widely spread over Europe and North America. No substantial additions have been made during the decade to our knowledge of this vague period; readers are referred to the reviews of Osborn (1918) and Lull (1917), also to the recent works of Gregory, *The Orders of Mammals* (1910) and *The Origin and Evolution of the Human Dentition* (1921).

Origin of Primates and of Man.—Combined palaeontological and anatomical evidence indicates that the source of the Primates is to be looked for among tree-living insectivorous mammals more or less closely similar to the modern tree shrews (*Tupaia*) of Africa. This view advanced with ability by Gregory is in general accord with the opinion that during the phase of arboreal life many of the psychic and anatomical characters of the Primates were acquired. It was not until the Lower Eocene of North America and of Europe that there appeared undisputed Primates of lemuroid affinity, *e.g. notharctids* and *tarsioids* in America, *adapids* and *tarsioids* in Europe. At this time the zoological relation of the two continents was close and it would appear that while the primitive horses were acquiring their cursorial characters on the ground, these primitive lemuroids were acquiring their distinctive characteristics in the trees. Actual ancestors of the existing *Tarsius* of Madagascar have been found in France (*Pseudoloris*). The attempt of Ameghino to trace the higher Primates to South American types, *e.g. Homunculus*, appearing in the Lower Miocene of Patagonia, is not supported, because these animals from the first are the true broad-nosed, *i.e. platyrrhine*, type still characteristic of South America. The Old World division of the catarrhines or narrow-nosed true Primates has been traced to the *Parapithecus*, described by Max Schlosser from the Lower Oligocene of Egypt. *Propliopithecus* is possibly ancestral to the true anthropoid apes and thus possibly related to the ancestors of man himself. Darwin's broad conclusion that man was derived from "some ancient member of the anthropomorphous subgroup of Old World Primates" is fully sustained by anatomical evidence, but the precise lines of descent are still in dispute. Some hold that the human line came from Middle Tertiary anthropoid apes allied to *Dryopithecus* of France and *Sivapithecus* of India, while others (including the present writer) regard the Hominidae as a widely distinct family separated especially by its upright walking gait, by the non-divergence of the great toe, and by the retention of its tool-making thumb. A series of masterly reviews of this whole question has appeared in the American Museum publications from Gregory, and a recent memoir *On the Structure and Relations of Notharctid American Eocene Primates* (1920) sums up our present knowledge of this whole subject. (See also ANTHROPOLOGY.)

Albanian Fauna of Alberta, Canada.—The greatest new

achievement in exploration is the revelation of the dinosaur fauna of Alberta in the fossil beds extending along the Red Deer river, which were first made known to science by explorers of the Canadian Geological Survey in 1897, 1898, 1901. The first general review of this wonderful fauna was that of Osborn and Lambe, *On Vertebrata of the Mid-Cretaceous of the North West Territory* (1902), based chiefly on the collections in the Ottawa Museum. The American Museum explorations under Barnum Brown, which extended over ten years, have resulted in the discovery of the entire fauna of the middle portion of Upper Cretaceous time, a complete revelation especially of the dinosaur world as it approached the height of its adaptive radiation into herbivorous and carnivorous, armoured and defenceless, swift-moving and slow-moving types, which severally imitate more or less fully the long subsequent adaptive radiation of the mammals. In 1914 the Canadians renewed exploration, so that at present the Ottawa and Toronto Museums have rich collections, part of which has been described by the late Lawrence M. Lambe, while Osborn, Barnum Brown and W. A. Parks have also made known a part of this wonderful fauna. Two of the greatest extremes of adaptation, namely, *Deinodon* or *Gorgosaurus* and *Struthiomimus*, are figured in the accompanying Plate II. In the same plate appear some of the outstanding American discoveries of the decade.

NEW DISCOVERIES AMONG FOSSIL VERTEBRATES

Fossil Fishes.—Dr. A. Smith Woodward's *Fossil Fishes of the English Wealden and Purbeck* (1915-8) is a beautifully illustrated memoir of the most thorough, systematic type, well sustaining the traditions set by Traquair and by the author himself in earlier works. The period dealt with affords an interesting cross-section of the stream of piscine evolution, at a time when many of the old Mesozoic ganoids were dying out and the teleost fishes were beginning their remarkable expansion. Other important systematic memoirs are those by Stolley on the ganoids of the German Muschelkalk (1920) and by Stensiö (1921) on Triassic fishes from Spitzbergen. The latter memoirs contain a wealth of material of great morphological interest concerning the early stages in the evolution of the skull of the fringe-finned and ray-finned ganoid fishes; this discussion also throws light on the origin of certain elements in the skull of higher vertebrates. In this connexion should be mentioned the brief but highly important paper on *Eusthenopteron* by W. L. Bryant (1919). This fringe-finned ganoid is of particular interest because the construction of its skull and paired limbs approaches the type which may be expected in the piscine ancestors of the land-living vertebrates. The arrangement of the elements on the under side of the skull of this fish raises morphological questions of wide general interest. Papers by Watson and Day (1916) and by Gregory (1915, 1920) deal with the ancestral relations of these fringe-finned ganoids with the land-living vertebrates (tetrapods).

The swarming fauna of Devonian arthrodires, ptyctodonts, cladodonts and other archaic fossil fishes from the vicinity of Buffalo, N.Y., is ably described by Bryant and Hussakof in their *Catalog of the Fossil Fishes in the Museum of the Buffalo Society of Natural Sciences* (1918). A serious difficulty encountered by all students of recent and fossil fishes is the getting in contact with the vast and scattered literature of the subject. The great *Bibliography of Fishes* by Bashford Dean and his associates Eastman and E. W. Gudger (1917) will undoubtedly stimulate research in this field.

Fossil Amphibians.—The outstanding publications in this field are *The Coal Measures Amphibia of North America* by R. L. Moodie (1916) and a memoir on *The Structure, Evolution and Origin of the Amphibia* by D. M. S. Watson (1919). Moodie's memoir is a valuable description and compilation of the extensive and varied fauna of swamp-living amphibians of the American Coal Measures. Watson's memoir is a brilliant and highly original contribution to the classification and phylogeny of the labyrinthodonts. Much detailed work on fossil amphibians appears in papers by von Huene, Broom, Williston, van Hoepen, Haughton and others.

Stem Reptiles.—In the field of the oldest reptiles, those of the Carboniferous and Permian, perhaps the most important contributions are those by S. W. Williston and D. M. S. Watson. The former, in his paper on *The Phylogeny and Classification of the Reptiles* (1917), traces the rise of the common amphibian-reptilian stock through the "Protopoda," which are so far known only from certain footprints of Upper Devonian age. According to Williston, who built on Osborn's system of 1903-4, the primitive reptilian stock early divided into the following series:—

Anapsida (Cotylosauria and their specialized descendants, the modern tortoises and turtles).

Synapsida (Theromorpha or pelycosaur, etc.; Therapsida, or mammal-like reptiles, the latter giving rise to the mammals; plesiosaurs).

Diapsida (reptiles with two temporal arches, such as crocodiles, dinosaurs, rhynchocephalians; this stock gave rise to birds).

Parapsida (including the proganosaurs, ichthyosaurs, lizards, mosasaurs, snakes).

Watson (1917), in his *Sketch Classification of the Pre-Jurassic Tetrapod Vertebrates*, assigns a high value in classification to the characters of the brain-case. A general and conservative classification of the early reptiles is given by W. K. Gregory (1920). The most primitive known reptile, *Seymouria*, from the Permian-Carboniferous of Texas, almost bridges the gap between the Amphibia and the Reptilia. Watson (1919) gives a morphological description of this reptile, accompanied by valuable figures and reconstructions of the skull and skeleton.

The habits and environments of the teeming reptilian and amphibian faunas of the Permian-Carboniferous of North America are intensively considered in a memoir by E. C. Case (1919), which also deals with the stratigraphy, climatology and palaeogeography of the late Palaeozoic.

Mammal-like Reptiles.—In no other field of fossil reptiles has the progress of discovery been more satisfactory than in that of the mammal-like reptiles of South Africa, as set forth in numerous papers, especially by Watson (1913-4), Houghton (1918), Broom (1913-4), van Hoepen and others. The relationships of these animals with other reptiles and with the mammals have been reviewed by W. K. Gregory (1920-1).

Marine Reptiles.—These have always been of great interest on account of their secondary adaptations to aquatic life which have been ably discussed by Abel (1912, 1919). One of the outstanding contributions of new material in this field is the *British Museum Catalogue of Marine Reptiles of the Oxford Clay* by C. W. Andrews (1910-3). The origin and relationships of the plesiosaurs and their allies are treated by von Huene (1921).

Dinosaurs.—The Triassic dinosaurs of Europe are of particular interest because some of them tend to connect the very diverse carnivorous and herbivorous saurischian dinosaurs of later ages. Here the leading author is F. von Huene, in a long series of papers and memoirs. *Plateosaurus*, perhaps the most primitive of these reptiles, has been fully described both by von Huene and by Jaekel (1913-6). Primitive dinosaurs from the summit of the Karroo series in South Africa (*Gryponyx*, *Massospondylus*, etc.) are described by Broom and Houghton. During the long ages of the Jurassic the gigantic sauropodous dinosaurs attained their maximum in size and specialization. The leading feature in this field is the description of the strange and monstrous dinosaurs of the Tendaguru fauna of East Africa in the collections of the Berlin Museum, by Janensch (1914). One of the most remarkable of the North American sauropods is the genus *Camarasaurus*, which has been intensively described by Osborn and Mook (1921). *Barosaurus*, a gigantic relative of *Diplodocus*, with a tremendously heavy neck, has been described by R. S. Lull (1919). *Tyrannosaurus*, the greatest carnivorous reptile of all time, and *Struthiomimus*, a contemporaneous ostrich-like dinosaur, have been described by Osborn (1912-9). The highly varied and grotesque armoured dinosaurs, namely, the Ceratopsia and related groups, have been the subject of numerous papers by Gilmore, Brown, Lambe and others.

Pterosaurs.—The pterosaurs, or flying reptiles, have continued to excite the interest of students of flight, such as Abel (1912), Watson and Hankin (1914), Arthaber (1921). The greatest

flying reptile, *Pteranodon*, is the subject of a memoir by Eaton (1910) of Yale University.

Chelonians.—An important memoir by O. Jaekel (1913-6) describes the skull, skeleton, carapace and plastron of *Triassochelys dux* from the Upper Triassic of Germany. Although widely differentiated from all other orders this reptile was the most primitive of all known chelonians. Of even greater interest is the *Eumelosaurus* from the Permian of South Africa which Watson (1914) describes as a veritable "Archichelone."

Fossil Birds.—*Diatryma*, a gigantic ground bird from the Lower Eocene of Wyoming, has been described by W. D. Matthew and W. Granger (1917) from a nearly complete skeleton, which is a most rare and valuable fossil. This bird, which has no near relatives, was about seven feet high and of massive proportions, with an enormous head and great compressed beak. The wings were vestigial. This high degree of specialization at such an early epoch indicates that the modernized groups of birds were differentiated during the latter part of the Age of Reptiles.

Monographs on Special Groups of Tertiary Mammals.—The fossil mammals of the basal and Lower Eocene of the western United States are represented in the American Museum of Natural History by collections numbering many thousands of specimens which are being described jointly by Matthew and Granger (1915). Besides describing many new or little known forms these authors also deal with the relationships and morphology of the various groups of early placental mammals. In the paper dealing with the edentates and their relatives, the "palaeanodonts," Matthew (1918) advances the view that the modern Pholidota (Pangolins) are an offshoot of the primitive "palaeanodonts" of the Lower Eocene. Other papers of the same series cover the Creodonts, Insectivores, Primates and Condylarths.

Several mid-Tertiary mammalian groups, such as chalicotheres, entelodonts and the diceratheres, have been revised in the publications of the Carnegie Museum, Pittsburgh, by W. J. Holland and by O. A. Peterson.

Baluchitherium, perhaps the most gigantic land mammal of all time, has been described by C. Forster-Cooper (1913) from a huge atlas, astragalus, cervical vertebrae and limb bones from the Upper Oligocene deposits of the Bugti Hills of Baluchistan.

The evolution of the Sirenia is treated by Abel (1921) and by Depéret (1920); that of the Cetacea by Abel (1919) and by Winge (1918-21). The phylogeny and evolution of the Proboscidea are considered in the researches by Schlesinger (1917), Matsumoto (1915) and Osborn (1918-21). The Eocene and Oligocene titanotheres have been dealt with in numerous papers by Osborn in preparation for his monograph on these extinct animals. The revision of the mid-Tertiary Equidae by Osborn (1918) affords an exceptionally full document on the exact course of evolution in the multitudinous phyla of a typical mammalian family. A most valuable expansion of our knowledge of the anthropoid apes of the mid-Tertiary is found in the work of Pilgrim (1915) on the fossil apes of India of the genera *Dryopithecus* and *Sivapithecus*.

South American Fossil Mammals.—The strange offshoots of the ungulate and edentate orders which swarmed in Patagonia during the mid-Tertiary and Pleistocene times are treated in the excellent memoirs of the Princeton University Patagonian expeditions by W. B. Scott. Herluf Winge has admirably monographed the fossil and recent edentates of Brazil. The mammalian fauna of the Descado formations is described by F. B. Loomis of Amherst College. These and other investigations are correcting the erroneous correlations by Ameghino, in which the older mammal-bearing horizons of Patagonia were assigned to the Cretaceous. This more modern work indicates that the Pyrotherium beds are not older than Upper Eocene and that the Santa Cruz formation is of Lower Miocene Age.

The Pleistocene fauna of Tarija, Bolivia, is the subject of a beautiful memoir by Boule and Thévenin (1920), in which the anatomy and relationships of "*Mastodon*" and of the highly specialized horses *Hippidium* and *Onohippidium* are treated.

*Pleistocene Mammalian Faunas (North America, Europe).—*The Pleistocene represents the climax of the Age of Mammals in point of differentiation and richness of mammalian faunas. In Europe the Pleistocene faunas have been the subject of memoirs by Boule, Schoetensack and many others. In North America we have the teeming fauna of the Rancho La Brea, California, described by Merriam, Stock and their colleagues of the university of California. The correlation of the American Pleistocene faunas has been treated especially by Osborn and by Hay.

In the preparation of this article the writer is especially indebted for the entire invertebrate section to the cooperation of Miss Marjorie O'Connell, who has summarized the chief discoveries in Pre- and Postcambrian time and given a review of the outstanding literature in the invertebrate field. He is also indebted to Charles D. Walcott, chief authority on Cambrian and Precambrian life of the world, for the type figures assembled in Plate I.; to Curators Matthew and Gregory of the American Museum for a revision of the text relating to the evolution of the vertebrates; and to the President and Trustees of the American Museum for permission to reproduce the photographs which are assembled to the same scale on Plate II.

(H. F. O.)

PALESTINE (see 20.600).—During the earlier years of the decade 1911-21 little of importance occurred in that country. Afflicted by the economic stagnation and financial strain which affected the whole Ottoman Empire in consequence of the war with Italy (1911-2), and the war with the Balkan States (1912-3), Palestine was unable to develop herself in any way before the outbreak of the World War in 1914. Yet to a section of her population the decision of the Palestinian Jews, in the autumn of 1913, to reject German and insist upon Hebrew as the language of instruction and to secede from the *Hilfsverein* and set up schools of their own, was momentous. The outbreak of the World War, besides leading to a renewed blockade of the coast, and fresh military requisitions, also involved the expulsion or internment of numerous ecclesiastics and laymen of Entente nationalities and the deportation of numbers of Jews. It was followed at the beginning of 1915 by one of the most destructive visitations of locusts recorded for a generation. Thereafter until the arrival of the British army in the autumn of 1917 the prosperity of the whole country slowly withered under the crushing burden of the war.

At the time of the British occupation of Jerusalem in Dec. 1917 the economic situation of southern Palestine was bad. Not only had the Turks requisitioned far and wide without repayment, or against inadequate payment, but they had cut down numbers of olives and revenue-producing trees and carried off the greater part of the agricultural and draught animals. The paper currency had depreciated some 84% and was no longer accepted by the producing classes—mostly outlying Moslem peasants—who would only discover their concealed stores of grain for gold. The civil population of Jerusalem, dependent ordinarily upon the pilgrim traffic or upon the offerings of pious Jews for its livelihood, was emaciated and reduced by starvation. The only products which Jerusalem had to sell were designed for the pilgrim trade and were unmarketable; consequently at the beginning of the occupation many shops were able to offer only cigarettes, picture-postcards and wild radishes for sale.

In view of this it was urgently necessary to provide food for the exhausted inhabitants of Jerusalem and Palestine, to provide work for the purpose of enabling them to earn money with which to pay for the food, and to re-start trade in order that the mercantile community should have something to barter against the gold hoarded by the peasantry and thus make it worth the peasant's while to cultivate and market his produce as he had for some time past realized that his gold was unable to buy the trade goods he required. But there were grave difficulties—the single line of railway by which alone food or trade goods could be brought from Egypt was very fully occupied with the paramount needs of the army. The daily tonnage of supplies alone—including munitions or transport of men or guns—varied from 800 to 2,300. Ammunition was often 250 tons per day. The civilian population was unaccustomed to the Egyptian currency, and more than suspicious of paper money, and Egyptian silver put into circulation was at once hoarded against the prox-

imate return of the Turks, which was confidently predicted by enemy sympathizers who further assured every one that the Egyptian paper pound at par was worth no more than the depreciated Turkish paper lira and offered to prove it by readily exchanging Turkish for Egyptian pounds whenever possible—at a profit to themselves of 17s. 7d. on each deal. Yet without money the civilians could not buy food, without food they could scarcely walk from weakness, and there was every prospect of the establishment of a vicious circle.

Brig.-Gen. G. F. Clayton (afterwards Sir Gilbert Clayton), chief political officer to Gen. Allenby, was appointed chief administrator and began to construct such a form of government as is provided for in "The Laws and Usages of War" laid down by international agreements embodied in the Hague Convention. Transport for a few truck-loads of foodstuffs per week was secured from the military railway, and lorries brought it to Jerusalem until the army was able to reopen the narrow-gauge line from Ludd to the Holy City. Then a small consignment of trade goods came up from Egypt and merchants were permitted to import small quantities from Egypt independently of the over-burthened railway. The labour corps employed numerous civilians, paying them at first daily in Egyptian silver and paper, and then weekly in cash or kind at the choice of the labourer. In this way the new currency came to its own, helped by the stringent measures taken by the military administration to suppress trafficking in or artificial depreciation of Egyptian paper. With the arrival of trade goods in the towns the peasants began to spend their gold and sell their produce so freely that it became unnecessary to import so much food and more accommodation thus became available for other merchandise. But even so, 900 tons of cereals had to be imported monthly for the use of refugees alone. Gen. Clayton took other steps to restore public confidence and reestablish the amenities of civilization. Bazaar gossip and rumour which for some weeks was hostile to the British was counteracted by the publication of Arabic and Hebrew editions of the newspaper, *The Palestine News*, which had been started by the army in March 1915, and intercourse with the greater part of the world was rendered possible by the restoration of the postal service, for which special stamps for the use of the civilian population began to be issued on Feb. 16 1918. Steps were taken to reassure the Moslems, who were much alarmed at reports sedulously propagated by the enemy, that all land was to be given to the Jews, and resident British officers were appointed to administer the various *kazas* of the old Turkish regime. Thus military governors were established at Gaza, with a deputy at Mejdcl; at Jaffa, with a deputy at Ramleh; at Beersheba; at Hebron, with a deputy at Deir Aban; and at Jerusalem, with deputies at Bethlehem, Jericho and Ramalla. At first the Occupied Enemy Territory Administration ("O.E.T.A.") was at Bir Salem, near Ramleh, the general headquarters of the army, but later when it became impossible for Gen. Clayton any longer to combine O.E.T.A. with the work of the political mission, Maj.-Gen. Sir Arthur W. Money was appointed chief administrator in April 1918, and he removed the administration to the imposing and convenient Empress Victoria Hospice built by the Germans on the Mount of Olives just before the war. In March the country had so far recovered that it became possible to collect taxes once more, in May public confidence was greatly increased by the skilful and tactful handling of the great Moslem religious festival of the Nebi Musa pilgrimage, invented by the Turks as an artificial check on the great Christian gathering at Jerusalem for the Orthodox Easter, with which it always coincides regardless of the Moslem calendar, and by the successful way in which the dangerous, and often fatal, ceremony of the Holy Fire on the Orthodox and Gregorian Easter was conducted by Col. Storrs the military governor of Jerusalem, and Haddad Bey the Syrian chief of police.

During the summer the administration was able to resume the payment of revenues appropriated by international agreement to the service of the Ottoman debt, but the income of the Moslem Waqfs (pious foundations) was used for the benefit of Moslem beneficiaries in Palestine instead of being drained

away to Constantinople. A local police force was built up, schools and law courts reopened and the country benefited largely not only by the roads and bridges built by the army, but from the wages paid locally by the army for labour and the transport system established by the army for the use of civilians. In the absence of the ordinary pilgrims the army furnished excellent substitutes, and Jerusalem began once more to flourish on the money freely spent by military visitors.

In April 1918 the Royal Engineers undertook a work of permanent utility to Jerusalem by way of compensating the inhabitants for the use made by the army of their carefully stored water supply. At that time the city depended upon an aqueduct yielding 1,650 gal. per hour and upon rain-water storage of about 360,000,000 gal. A new reservoir containing 200,000 gal. was built above the town and fed from the Wadi 'Arrub springs 12 m. S. (used for the same purpose in the days of Herod and Pontius Pilate by the Romans) at the rate of 12,500 gal. per hour. This system, opened on June 18, was subsequently improved by the British administration.

The visit of the Zionist commission under Dr. Chaim Weizmann and the careful abstention from controversial topics of the only Palestine newspaper did much to abate the alarm of the Moslem population caused by Mr. Balfour's declaration. A further useful function was performed by the army in its sales of young camels and cast army beasts by public auction at Ramleh. According to local standards a "cast" army animal was in more than the prime of life and buyers came from the Hejaz and other parts of Arabia to buy the baby camels which had been born of unusually well fed and healthy parents and had themselves been nourished on a scale of efficiency entirely unknown to native camel masters.

Later in the year when the Sept. advance had finally driven the Turks out of Palestine the O.E.T.A. was divided into three sectors—South (Jerusalem) East (Damascus) and North (Beirut). A little later, after the Armistice of Nov. 11 1918 and the subsequent occupation of Cilicia, O.E.T.A. North became O.E.T.A. West, and a new north sector was formed at Adana. In O.E.T.A. South, of which Gen. Money continued as chief administrator, British military governors were established at Nablus with a deputy at Hable; Jenin with a deputy at Beisan; Tul Keram; Haifa, with deputies at the Jewish colony of Zimmarin and Acre; and Nazareth with deputies at Tiberias and Safed. On August 15 1920 the system of governorships for Palestine was revised, Hebron was added to Jerusalem, Tul Keram was added to Jaffa, Nazareth and Tiberias were amalgamated to form Galilee, Haifa district became Phoenicia, and Nablus and Jenin were amalgamated to form Samaria. Thus Palestine is now administered by five district governors at £E1,200 a year each, with the help of assistant governors and by two district governors at £E850 each (Gaza and Beersheba).

In the spring of 1919 Sir Arthur Money was succeeded as chief administrator of O.E.T.A. South by Maj.-Gen. Sir Louis Bols, formerly General Allenby's chief of staff, who had to contend with a difficult situation. As no peace settlement had been arrived at, he still had to administer the country on Turkish lines in conformity with the "Laws and Usages of War," while on the one hand eager Zionists complained that nothing was being done to carry out the Balfour declaration as interpreted by its most extreme partisans, and on the other the Moslems protested against what they considered to be Jewish aggression, and various foreign powers sought to establish or revive their influence among the various Christian communities in the country. The Arab tribes beyond Jordan were not under proper control, as the Sherifian government in Damascus was not strong, and parties of desert freebooters revived the time-honoured custom of raiding the settled lands. This combined with the anti-foreign agitation which arose out of the difficulties and delays caused by the contradictory assurances given at one time and another on behalf of the British Government to the French and the Arabs led to serious trouble which was brought to a head soon after the Emir Faisal had been declared King of Syria in Damascus (March 10 1920). In Jerusalem the Moslem procession at the Nebi Musa celebrations was exploited as a manifestation of Arab Nationalist sentiment against the Zionist Jews, many of whom had excited the animosity of the Moslems

by unwise and tactless propaganda. Public statements had been made which Moslems could easily misunderstand and represent as threats against their own undisturbed possession of their ancestral properties and sacred sites, and a counter-propaganda directed towards a general agreement of Moslem land-owners to refuse to sell or lease land to non-Moslems had played its part in inflaming the crowd against Jewish immigrants. Riots took place on April 4 and 5, and, as the Moslem police in many cases preferred to yield to religious enthusiasm instead of doing their duty impartially, order had to be restored by British and Indian troops. The casualties were 5 Jews and 4 Moslems killed, 212 Jews, 22 Moslems and 2 Christians wounded. A number of persons were arrested and among the Jews sentenced for "possessing firearms, instigation to disobedience by arming the populace, conspiracy and preparing means to carry out acts of riot" was Mr. Vladimir Jabotinsky who had played a distinguished part in helping to raise a Jewish battalion for the British army. Several Moslems were sentenced to long terms of imprisonment for rape or for possessing firearms. Mr. Jabotinsky's sentence was shortly afterwards reduced and he was released on July 8 under the amnesty which followed the introduction of civil government. Later in April, the Ghazzawiye Arabs raided Beisan on several occasions and carried off 119 head of cattle and 250 sheep and goats, and on April 24, 2,000 Arabs attacked the British garrison at Semakh, but had to retreat leaving 100 casualties behind them. Raids were also made further down the Jordan valley, and in the N. some 2,700 refugees, Christians and Jews, fled into Palestine in May to avoid the Metawali who were massacring in the hills above Tyre.

On July 1 1920 the Rt. Hon. Sir Herbert Samuel became first high commissioner of Palestine under the mandate which was in principle accorded to Great Britain at the San Remo conference in April, although the text of the document was not drafted until 1921 and its precise terms had not yet actually been confirmed by the council of the League of Nations. Civil Government was introduced, and for the first time, the British flag was hoisted over Jerusalem. An amnesty was granted (July 8), the censorship was abolished (July 19), and on August 31 an advisory council composed of seven Moslems and Christians and three Jews was created to sit with the high commissioner. At the same time Hebrew was declared an official language together with English and Arabic, and made obligatory for public notices in areas inhabited by 20% or more of Jews (Jerusalem City, and the kazas of Jaffa, Tiberias, Safed, Ramleh and Haifa). Drinking-bars were suppressed throughout Palestine, and the use of stucco and corrugated iron for new buildings or repairs within the walls of Jerusalem was prohibited.

At the end of 1920 the payments of various dues to the account of Ottoman Regie and the prohibition against the cultivation of tobacco in Palestine came to an end.

Frontier.—On Dec. 23 1920 the frontiers of Palestine towards French Syria were fixed in such a way as to include a small additional area, comprising Kades, Metulla and Dan, in Palestine, but retaining the whole of the Litani-Leontes watershed for Syria. In April 1921 the visit of Mr. Churchill, Secretary of State for the Colonies, to Jerusalem, afforded an opportunity for interview with the Emir 'Abdalla, brother of the Emir Faisal, which resulted in the recognition of Arab authority over the territories to the east of Jordan (see TRANSJORDANIA), thus fixing that river as the eastern boundary of Palestine except at Semakh on the Sea of Galilee.

Immigration.—During 1920, as transport became available, a number of expatriated Jews began to return to Palestine, as well as new Jew immigrants, many of whom (*Halutzim*) were employed by the Zionists in the work of opening up and reconstructing waste lands, for additions to which the Jewish National Fund raised £100,000 during the year. On Oct. 22 1920 the deported German colonists, chiefly from the Haifa district, were allowed to return.

Some of the new immigrants seem to have adopted communistic views before leaving Russia, and on May 1 1921 a party of the disturbed a Jewish labour meeting at Tell Aviv ('Ani), near Jaffa. A struggle ensued in which Moslems became involved, and the riot developed into a racial riot of so formidable a nature that the local police were unable to suppress it, and British troops had to be called in. Although the riot was stopped that evening, there was further trouble for two or three days. At no time, however, did the troops have to open fire in Jaffa, but the rioters killed 30 Jews and 10 Arabs and injured 170 Jews and 57 Arabs, before order was restored.

The police arrested 66 rioters, and the leading notables of both religions concerned cooperated with the authorities in calming the population. An inquiry was subsequently held by the Chief Justice of Palestine and two British officials, while Jewish immigration into the Holy Land was suspended for two months (until July 8).

Jewish Agricultural Colonies.—For many years past the piety of Jews all the world over has prompted them to contribute towards the support of the large numbers of Jews resident in or immediately outside Jerusalem on the understanding that the constant prayers and wailings of these—the Jews of the *Haluka*—should benefit also their benefactors. A more modern development of this system led to the foundation of a number of agricultural colonies in other parts of Palestine, which also were for many years dependent upon outside benevolence. With the growth of experience the agricultural colonists, unlike their brethren of the *Haluka*, tended to become more and more self-supporting under the guidance of Baron Hirsch's foundation, the J.C.A. (Jewish Colonization Association), which first began to treat the colonies as a commercial rather than a charitable or sentimental proposition. The earlier colonies had devoted themselves exclusively to viticulture and were embarrassed alike by the attacks of phylloxera and the difficulty of marketing their wine. After the introduction of almonds and oranges and other fruits prospects improved, but until the end of the Turkish period the colonies were much hampered by legal difficulties connected with the purchase and tenure of land, the status of the colonists and the lack of a definite policy. During the war the colonies suffered owing to the deportation of many of the colonists, the requisitions of the military, and the cutting down of large numbers of trees, as well as from the loss of all their foreign markets.

After the war the Zionist Commission greatly improved the prospects of Jewry in Palestine, which, under the Balfour Declaration of 1917, was to become once more a national home for the children of Israel, by organizing a new national life and arranging for the immigration of the *Halutzim*, or Pioneers, young and zealous workers from all parts of Jewry, who began to prepare the country for future arrivals. In 1920 the influx of Jews into Jerusalem was shown by the Immigration Department of the Zionist Commission as follows: Jan. 122, Feb. 139, March 124, April 122, May 98, June 105, July 107, Aug. 178, Sept. 237, Oct. 197, Nov. 218, Dec. 233; total 1,860, of whom 1,251 were men and 609 women, of whom again 1,169 were new immigrants and 696 returning refugees. Jaffa is the principal port of entry, 1,400 Jews having landed there in Sept. 1920. It is estimated that between Dec. 1919 and March 1921 some 11,000 Jews entered Palestine, of whom 3,000 were returning refugees. On the other hand some 3,000 persons emigrated from Palestine during the same period, among whom were many Jews.

The bulk of the new immigrants, up to the end of March 1921, came from Poland, Russia, Morocco, Austria, Syria, Bulgaria, Rumania, Egypt, Hungary, Persia, France, Greece, Germany and England. Each immigrant is provided with a certificate of origin from the Zionist Emigration Office (Palestine Office).

The table shows the area and population of the Jewish colonies founded before the British occupation:—

Land Transfer.—During the whole of the military administration and until Oct. 1920 the sale or transfer of land in Palestine was forbidden, partly because the Turks had removed all official land registers in which appeal could be made for the settlement of disputed titles, and partly to avoid internal trouble which might arise from the transfer of land from a vendor of one religion to a purchaser of another. When this order was rescinded there was no great activity in the estate market in Palestine as a strong movement had been set on foot among Moslems to retain land already owned by Moslems in Moslem hands, and also because the delay in issuing the Mandate and the world-wide financial crisis militated against the economic development of Palestine in general, and land purchase there in particular. Some small parcels of land belonging to Moslems were sold to Jews, but, apart from that, the Jews have acquired no land since the war, with the exception of the university site on Mt. Scopus from the executors of Sir John Grey-Hill.

Ecclesiastical.—In matters ecclesiastical the British authorities were able to steer a careful course between the various conflicting interests, and Col. Storrs, the governor of Jerusalem, was so far able to abate the customary tension between the representatives of the different creeds that the Orthodox at Bethlehem voluntarily removed the unsightly wall which had been built across the nave of the Church of the Nativity chiefly for the purpose of causing annoyance to the Latins; and the Gregorians invited the Anglican bishop, Dr. MacInnes, who had succeeded as bishop in Jerusalem after the resignation of Dr. Blyth in Oct. 1914, to take an important part in their Easter ceremonies in 1918. After the final defeat of the Turks the Orthodox and Latin patriarchs who had been held prisoners in Damascus returned to Jerusalem, when Mgr. Damianos, who had had difficulties with his Holy Synod, was reinstated by the chief administrator. Mgr. Camassei, the Latin patriarch, however, withdrew soon afterwards to Rome, where he became a cardinal, and in April 1920 Mgr. Louis Barlassina was appointed to succeed him in Jerusalem, while on Oct. 9 1920 Father Paschal Robinson was sent to Palestine as apostolic visitor. On March 20 1921 His Eminence the Grand Mufti of Jerusalem, Kamil Huseini Effendi, died, and

after some delay his brother, Hajj Amin, was appointed (May 1921) to succeed him.

Population.—On March 31 1919 the pop. of O.E.T.A. South was 647,850, of whom 515,000 were Moslems, 65,300 Jews and 62,500 Christians. There were 150 Samaritans and 4,900 others. The present area of Palestine is larger than O.E.T.A. South.

The 1919 census figures for the pop. of various towns, showing Ruppin's 1914 estimate in each case in brackets, are as follow:—

	1914 Estimate of Ruppin	Census of 1919
Jerusalem	(80,000?)	60,000
Jaffa	(40,000?)	40,000
Nablus	(30,000)	28,000
Haifa	(20,000)	20,000
Hebron	(20,000)	18,000
Gaza	(30,000)	—
Nazareth	(12,000)	15,000
Safed	(24,000)	12,500
Acre	(12,000)	10,000
Tiberias	(8,000)	8,000
Bethlehem	(12,000)	15,000

Gaza, credited with 30,000 inhabitants in 1914, was entirely depopulated during the war as a military measure by the Turks. The inhabitants were beginning to return slowly to the completely ruined town in 1921.

Of the three divisions of the pop. of Palestine 69% of the Moslems, 46% of the Christians and 19% of the Jews were engaged in agriculture in 1919. In 1918 taxes were paid on 139,000 domestic animals (Southern Palestine only), in 1919 on 531,000 animals (Northern Palestine as well) and in 1920 on 543,000.

Finance.—The budget for Palestine for the first year under British occupation, ending Oct. 1918, showed a revenue from direct taxes £E160,000, from customs and excise £E122,000 and from other normal sources £E54,000. The artificial revenue of £E324,000 drawn from the operation of the services of relief for refugees failed to balance their cost, £E331,000, thus the revenue for purposes of ordinary expenditure amounted to £E337,000 and the expenditure to £E407,000, which included £E141,000 of revenues mortgaged by the Turks for the services of the Ottoman Debt and to meet the kilometre guarantee on railways in other parts of the Empire. It should also be remembered that, while the cost of administering northern Palestine for six weeks is contained in the budget, no revenue at all was collected in that area, as the taxes had all been exacted in advance by the Turks. On the other side, however, it must be noted that the private charity of the American Red Cross and other funds contributed more than £E40,000 *per mensem* towards the maintenance of refugees and destitute civilians, which would otherwise have been a charge upon the Treasury.

In 1918-9 the actual receipts were £E748,000 from all sources and the estimated expenditure £E738,000. For 1919-20 the estimated figures were £E735,000 for both, exclusive of £E284,000 of revenue and £E162,000 of expenditure in the "Excluded Funds" assigned to municipalities, Waqf administration, the Ottoman Debt and railway guarantee outside Palestine. For the first nine months of civil administration ending March 31 1921 the total revenue, excluding that from railways and post-office, was estimated at £E776,000 and the expenditure at £E731,000, while the railways and post-office were expected to yield a net profit of £E30,000, thus showing a surplus of £E75,000. For the first complete financial year under civil administration, 1921-2, the total revenue—including railways and post-office—was estimated at £E2,214,000, and the expenditure at £E2,286,000.

The following table shows the detailed revenue from direct taxation and State domains for the two financial years 1919-20 and 1920-1:—

		House and Land Tax £E	Animal Tax £E	Tithe £E	State Domains £E	Stamp Duty £E	Total £E
Jerusalem	1919-20	29,089	7,399	28,173	1,437	2,743	68,841
	1920-21	29,500	8,000	36,000	2,000	4,000	79,500

*Dunam = 1,075.2 sq. yd.

The customs revenue collected at various ports of entry and railway and caravan centres for the same two years was as follows:—

	1919-20 £E	1920-1 £E
Acre	214	534
Beersheba	463	314
Gaza	10,092	6,095
Haifa	164,391	169,031
Jaffa	146,204	186,336
Jerusalem	93,779	71,161
Khan Yunis	645	586
Ludd	1,803	5,255
Tul Keram	5,094	5,642
Qantara	5,375	3,449
Total	428,150	449,000

Municipalities.—There are 22 municipalities in Palestine: Jerusalem, Ramallah, Beit Jala, Bethlehem, Hebron, Jaffa, Ramleh, Ludd, Gaza, Khan Yunis, Mejdell, Feluje, Beersheba, Nablus, Tul Keram and Jenin in Samaria; Nazareth, Tiberias and Safed in Galilee; and Haifa, Acre and Shefa 'Amr in Phoenicia. In 1919-20 their total revenue amounted to £E89,000 (Jerusalem £E29,500, Jaffa £E14,700) and their ordinary expenditure to £E89,000. They had a balance of £E9,000 from the previous year and obtained loans and grants from Government amounting to £E10,000, repaying debt to the amount of £E11,000.

Education. Palestine before the British occupation contained numerous schools supported by religious bodies and charitable organizations abroad, some of which were undoubtedly supported more in the political interests of the countries concerned than for strictly religious or educational purposes, and it is possible that in the future certain institutions may suffer financially from the decay of that political driving-force. For the year 1919-20 the Military Administration granted £E46,000 for Moslem education, and for 1921-2 the Civil Administration has allotted £E103,000, and employs 443 teachers. In addition to this the Zionist Organization in 1920-1 provided for 135 educational institutions with 523 teachers and 12,830 Jewish pupils at a cost of about £E110,000. Christian schools in 1919-20, generally open to pupils of all denominations, provided for some 7,000 children, but many of these institutions had been adversely affected by Turkish requisitions during the war and had not recovered.

Defence.—Under the final rearrangement of the Ottoman army before the World War Palestine formed part of the recruitment area of the VIII. (Damascus) Army Corps, and after the war was held by a considerable army of occupation composed of British and Indian troops. This, consisting of three Army Corps with a ration strength of over 460,000 men and some 163,000 beasts at the time of the Armistice, was reduced to 23,000 men on April 1 1920, and to 7,700 men on April 1 1921. The scheme of local defence provides for the formation of two battalions of troops to be recruited in Palestine, and a police force has already been raised consisting on April 1 1921 of 78 officers and 1,392 other ranks, divided into four categories:—

	Mounted	Foot	Railway	Prisons
N.C.O.s	47	72	4	16
Men	397	712	50	85
Total	444	784	54	109

Railways.—Although several schemes for railway construction in Palestine were proposed during the period 1910-4, nothing was done. On Oct. 14 1913 a Franco-Turkish agreement provided for an extension of the standard-gauge line from Rayak in Syria to Ludd in Palestine, where it would join the then existing narrow-gauge line from Jaffa to Jerusalem. By the same agreement a French firm was to obtain concessions for building harbours at Haifa and Jaffa, and a little later a concession was granted to the Perrier Bank to run a tramway from Jerusalem to Bethlehem. None of these proposals was carried out, but during the war the Turkish Government built an extension of the Hejaz railway from Jenin on the plain of Esdracel through Messudiye (56 km.) to Nablus (15 km.) on the one hand, and on the other to Tul Keram (20.5 km.) and thence to Ludd (42.5 km.), and from Junction Station to Beersheba (83 km.), whence the line was taken on to El 'Auja (66 km.) for the attack on Egypt. A narrow-gauge branch line was run from Tine on the Junction Station-Beersheba railway to Beit Hanun (39 km.), near Gaza, with a branch from Deir Sineid to Huj (12 km.), and another from Tul Keram to the forest near Caesarea (24 km.), which was cut down for fuel. Owing to the shortage of railway material the lines between Damascus and Mezeirib (63 km.), Haifa and Acre (18 km.) and Jaffa and Ludd (20 km.) were stripped and the rails sent south to be used for the new extensions. Later the Beersheba-El 'Auja extension was stripped in its turn and the Tine-Beit Hanun-Huj branch was removed after the arrival of the British.

The British-built standard-gauge line laid across northern Sinai, Qantara-Romani (41 km.), opened July 1916; Romani-El 'Arish (114 km.) in 1917, El 'Arish-Rafa (45 km.) Mar. 1917, reached

Deir el Belah (219 km.) from Qantara in June 1917, and a branch from Rafa to Karm (34.5 km.) was opened Oct. 28 1918. This was later continued to Beersheba (24.5 km.) and opened May 3 1918. The metre-gauge railway from Ludd to Jerusalem, much damaged during the military operations in the autumn of 1917, was restored and reopened Jan. 27 1918. Meanwhile, the standard-gauge from Belah had been opened to Deir Sineid (28 km.) Nov. 28 1917, and to Deiran (43 km.) Jan. 8 1918. On Feb. 4 1918 it was opened to Ludd (15 km. or 305 km. from Qantara) and carried on to Rantie (9 km.) a little later in readiness for the next forward move. While waiting for this, the standard-gauge was opened to 'Artuf (31 km.) on March 31 and to Jerusalem (29 km.) June 15. This last section was laid by day, while the narrow-gauge which it superseded continued to work by night. The Turkish narrow-gauge between Junction Station and Irgeig (72 km.) on the Rafa-Beersheba line was converted to standard gauge between May 18 and July 8; thus Gen. Allenby was able to dispose of a double line of standard gauge from his advanced base at Ludd to Rafa, to which point the railway from Qantara had been double-tracked by April 17 1918. Later, in 1919-20, the sector Junction Station-Irgeig was dismantled. A number of narrow-gauge lines were laid behind the front between Dec. 1917 and Sept. 1918: Ludd to Jaffa (20 km.), Ludd to Ras el 'Ain (22 km.), Sarona (on the Jaffa line) to near Jelil (14 km.), Kefr Jinnis on the Ras el 'Ain line to Lubban (18 km.), Sheikh Muannis on the Sarona line to Carrick Hill (3 km.), and from Jerusalem to Bire (28 km.). The standard-gauge started north once more on the heels of the Sept. advance, and was superimposed on the Turkish line from Ras el 'Ain to Tul Keram (32 km. from Rantie) which was reached on Oct. 15. The extension to Haifa (66 km.; 413 km. from Qantara) was opened early in Jan. 1919 and soon afterwards the narrow-gauge Acre branch (18 km.) was restored. On Oct. 5 1920 the standard-gauge was opened between Ludd and Jaffa (20 km.).

Agriculture.—The crop returns for 1920-1 show the following figures in kilogrammes:—

	Kgm.
Wheat	62,807,017
Barley	27,233,948
Beans	2,061,306
Peas	3,441,525
Lentils	2,724,635
Kersenneh (Jilbaneh)	4,599,944
Durra	30,352,916
Sesame	2,488,229
Olive Oil	6,706,059
Grapes	5,490,306
Figs	5,419,878
Melons	16,351,022
Almonds	238,090

Total Kgm. 170,004,875
Oranges, Lemons, etc. 537,043 boxes

Of this total of 170,004,875 kilogrammes the production according to districts was as follows:—

	Kgm.
Jerusalem	27,580,480
Jaffa	40,866,228
Gaza	11,170,179
Phoenicia	35,852,954
Beersheba	9,005,058
Samaria	17,686,452
Galilee	27,834,524

Of the 537,000 boxes of oranges and lemons the Jaffa district produced 498,000, Phoenicia being second with 36,000.

Trade.—The bulk of the sea-borne commerce of Palestine passes through its three chief ports of Gaza, Jaffa and Haifa. Of these Haifa, before the war, had begun to supplant Beirut to a certain degree as the port of Damascus, the Hauran and Gilead and, in virtue of its connexion by rail with Medina, handled goods in transit for that area as well; consequently its trade was Syrian rather than Palestinian and recovered sharply after the end of the Italo-Turkish War in 1912. Gaza was concerned almost entirely with an export trade of barley, chiefly used for making beer in England, while Jaffa, with all its drawbacks, served as the chief port for exports and imports of purely Palestinian origin and destination. The standard-gauge railway leading to Egypt is also a great trade route, more particularly for passengers and those classes of goods which suffer from the delays still inevitable in bad weather at Jaffa.

The total trade of Palestine for the first complete year during which the whole country was under British administration and at peace, April 1919-March 1920, was:—

	Imports	Exports
April-June 1919	£E1,008,938	£E130,463
July-Sept. "	861,869	129,719
Oct.-Dec. "	984,926	196,552
Jan.-March 1920	1,296,334	236,968
	£E4,242,067	£E693,702

PALGRAVE—PANAMA

21

Of this the respective shares of Jaffa and Haifa as compared with the last complete year before the war—both calculated in £E—were:—

	Imports £E	Exports £E
Jaffa		
1913	1,279,785	726,775
1919-20	1,408,238	169,308
1920-21 (first 7 months)	1,186,079	127,360
Haifa		
1913	516,750	338,033 (1912)
1919-20	1,627,381	270,057
1920-21 (first 7 months)	950,155	116,795

From this it is apparent that while Palestine had to buy largely and at enhanced prices of those goods of which she was unable to procure adequate supplies during the war, she had not yet recovered her capacity for production after the dislocation of trade and ruin of agriculture caused by the war, with the consequence that the balance of trade was against her. It has been pointed out, however, that her exports are bulkier than her imports, and that had tonnage been available the exports would have been greater.

The deficiency of available tonnage is well shown in the following shipping figures for ports of Palestine:—

Flag	Number of Ships 1913	Number of Ships 1919-20	Tonnage 1913	Tonnage 1919-20
British	307	97	464,674	123,116
Russian	237	55	405,987	27,244
French	101	41	262,512	71,904
Italian	97	99	170,227	176,504
Austrian ¹ and Other	496	65	658,302	67,946
	1,238	357	1,961,702	466,714

Currency.—The currency in Palestine, formerly Turkish, became Egyptian at the time of the occupation as the accounts of the Egyptian Expeditionary Force were kept in that medium. A vast quantity of British, Australian and Indian silver, however, came into circulation at fixed rates to supply the deficiency of Egyptian silver—of which a large consignment sent from the London mint for use in Palestine was sunk by enemy action at sea—and a good deal of gold, chiefly British, came into the country from Arabia where a large amount of the gold coin paid as subsidy to the king of the Hejaz passed into circulation. French silver, generally taken at full value in the larger towns before the war, is now seldom seen, and Turkish silver and billon money has also nearly disappeared, although legal tender at fixed rates. Turkish paper was never legal tender after the occupation.

Weights and measures still vary locally according to immemorial custom, but the civil administration is taking steps to introduce a standard system on European lines in order to facilitate trade.

Archæology.—On Aug. 9 1920 the British School of Archæology in Jerusalem was opened and participated in the excavations which were being conducted at Ascalon, with happy results, by the Palestine Exploration Fund. Important discoveries were made also in the Garden of Gethsemane, where the complete foundations of a 4th-century church were brought to light, and near Tiberias.

The duty of maintaining historical buildings in the Holy City has been entrusted to the Pro-Jerusalem Society—a pan-denominational body founded by the governor, Mr. Ronald Storrs. At Acre mediæval crypts have been cleared of debris, the Tower of Ramleh has been strengthened and arrangements have been made for a resumption of the excavations at Tell Hum (Capernaum) by the Franciscans. Three universities in the United States have agreed to undertake important archaeological researches, that of Pennsylvania at Beisan (Beth Shan), that of Harvard at Samaria and that of Chicago at Megiddo (for which Mr. John D. Rockefeller, Jr., gave \$60,000). Unauthorized excavations by persons unqualified as archaeologists are forbidden. In the Budget for 1921-2 a grant of £E1,000 was made for the conservation of historical monuments, and £E750 provided for the redemption of antiquities out of a total estimate for the Department of Antiquities of £E6,500.

(H. P.-G.)

PALGRAVE, SIR ROBERT HARRY INGLIS (1827-1919), English banker and economist, was born at Westminster June 11 1827, the son of Sir Francis Palgrave, the historian (see 20-529). He was educated at Charterhouse and entered Barclay's Bank at Yarmouth. There he rose to a position of such importance that in 1875 he was one of three representatives of the English issuing country bankers chosen to give evidence before the select committee of the House of Commons on Banks of issue. He edited the *Economist* from 1877 to 1883, and published many works on banking, as well as *The Local Taxation of*

¹ Much tonnage formerly Austrian was in 1921 Italian.

Great Britain and Ireland (1871). He also edited the *Dictionary of Political Economy* (1894-1906). He was knighted in 1909. He died at Bournemouth Jan. 25 1919.

PALLES, CHRISTOPHER (1831-1920), Irish lawyer, last chief baron of the Irish Court of Exchequer, was born Dec. 25 1831. He was educated at Clongowes Wood school, and Trinity College, Dublin, where he graduated in 1852. He was called to the Irish bar in 1853, and became a Q.C. in 1865. In 1872 he became a solicitor-general for Ireland, and from 1872 was attorney-general. In 1874 he was made chief baron of the Court of Exchequer. The Exchequer division was in 1898 merged in the Queen's Bench division of the Irish High Court of Justice, and the chief baron from that time sat as one of the judges of the Queen's Bench division, and also as a judge of appeal. Palles retired from the bench at an advanced age in 1916. He was a great lawyer, of remarkably wide learning and power of argument. He died in Dublin Feb. 14 1920.

PALMER, ALEXANDER MITCHELL (1872-), American politician, was born of Quaker parentage at Moosehead, Pa., May 4 1872. After graduating from Swarthmore College in 1891 and admission to the bar in 1893 he practised law at Stroudsburg, Pa. He was a member of Congress from 1900 to 1915, was then appointed judge of the U.S. Court of Claims, but resigned four months later. In 1912 and 1916 he was a delegate-at-large from Pennsylvania to the Democratic National Convention, and from 1912 a member of the executive committee of the Democratic National Committee. At the convention of 1912 he was "floor leader" of the Wilson supporters, and the next year declined the post of Secretary of War in President Wilson's Cabinet. In 1917 he was appointed alien property custodian under the "Trading with the Enemy Act," and within 18 months was administering 32,000 trusts, valued at \$503,000,000. In March 1919 he was appointed to the President's Cabinet as Attorney-General. The Senate refused to confirm the appointment until his record as alien property custodian had been investigated, on the ground that he had made his office a "political machine." It was furthermore charged that he was in contempt of the Senate in having failed to submit on request a complete report of the management of his office. A filibuster at the end of the 65th Congress caused the Senate to adjourn without confirming the appointment, but the President made him a "recess" appointee. Not until Aug. 30 1919 did the Senate Judiciary Committee hand in its report recommending the appointment. This was followed by confirmation. His career as Attorney-General was widely, and it was generally felt justly, criticized by the public at large and by competent legal authorities as being both arbitrary and inefficient. At the Democratic National Convention in 1920 he had strong support for the presidential nomination, standing second on the first six ballots. After a prolonged deadlock, extending through 38 ballots, he released his delegates, who swung to James M. Cox, nominated on the 44th ballot.

PALMER, SIR WALTER, 1ST BART. (1858-1910), English manufacturer, was born at Reading Feb. 4 1858. He was the son of George Palmer (see 20.644), founder of the firm of Huntley & Palmer, biscuit manufacturers, of Reading, and was educated at University College, London, and also at the Sorbonne, Paris. He became a director of the firm and was also the first chairman of University College, Reading. He sat in the House of Commons for Salisbury during 1900-6. In 1904 he was created a baronet, and he died at Newbury April 16 1910. His elder brother, GEORGE WILLIAM PALMER (1851-1913), was chairman of the firm and sat in the House of Commons for Reading from 1892 to 1895 and from 1898 to 1904. He was made a privy councillor in 1906. He died near Newbury Oct. 8 1913.

PANAMA (see 20.664).—The pop. of the South American republic of Panama at the end of 1911 was estimated at 336,744 for the area exclusive of the Canal Zone. The latter contained in that year 71,682 persons, the number decreasing to 31,248 in 1916 and to 21,707 in 1918. In the estimate made in 1913, whites and mestizos, those of mixed blood, numbered 238,200, and negroes and Indians 96,600. Foreigners included 3,200 Chinese

and 55,000 British subjects from Caribbean islands. The cities of Panama and Colon in 1917 contained 61,369 and 26,076 inhabitants respectively; the estimated total pop. then being 401,554. A general census taken in 1920 gave a total pop. of 434,015.

Vital statistics for 1916, 1917 and 1918 showed respectively 11,593, 10,898, and 11,283 births, of which in each year respectively 7,827, 7,511 and 7,700 were illegitimate. Deaths in the same years numbered 6,218, 6,107 and 5,649 respectively. There are eight provinces, Herrera having been added in 1915. The area as determined by the White boundary award is 87,480 sq. km. (33,776 sq. miles).

In 1917 there were 308 Government-supported schools with an enrolment of 22,000, besides 1,721 pupils in Canal Zone schools. The Instituto Nacional, dedicated in 1911 with handsome buildings at Panama costing \$1,500,000, gives instruction in high-school subjects, commerce and languages. A school of Law and Political Science offers a three-year course to graduates of the Instituto. Travelling scholarships to Europe and the United States are provided by the Government.

Finance and Economics.—Panama receives all the import duties collected, but the United States imports all canal materials and supplies for Government use duty free. Panama's revenues and expenditures 1915-20 were as follows:—

	Revenues	Expenditures
1915	£ 675,057	£ 635,820
1916	729,802	1,164,600
1917	793,882	732,171
1918	646,752	707,464
1919-20	1,490,385	1,490,385 (estimated)

Public finance is managed by a fiscal agent appointed with the approval of the United States. For nine months ending in March 1921, revenues received were \$4,012,023, and expenditures \$2,767,146; balance \$1,244,877; of this sum \$739,349 was set aside for road construction. The debt, begun early in 1915 with a loan of \$3,000,000 from the United States, chiefly for railway construction, amounted in 1919 to \$7,101,000.

Commerce is chiefly with the United States; but that with the United Kingdom, France, and Spain is important.

The totals for the years 1910-20 were:—

	Imports		Exports	
	Kgm.	Balboas *	Kgm.	Balboas *
1910	128,047,313	10,043,395.11	126,333,609	1,769,330.15
1911	128,331,874	9,896,987.85	165,180,189	2,803,425.30
1912	115,822,532	9,871,653.73	166,232,433	2,064,647.55
1913	153,057,605	11,060,088.24	187,330,063	5,101,960.45
1914	140,472,718	9,891,552.78	182,625,216	3,800,517.18
1915	126,244,629	9,032,977.17	152,594,343	3,422,455.10
1916	107,191,027	9,397,596.27	137,438,898	5,706,724.38
1917	82,798,113	9,223,170.00	177,484,046	5,624,176.00
1918	45,085,659	7,821,660.00	150,497,870	2,909,557.00
1919	48,960,768	11,406,880.15	162,476,039	3,757,028.24
1920	59,678,802	17,092,270.35	150,370,225	3,640,453.15

* A balboa is worth a dollar.

About 80% of the exports go to the United States. The chief articles are bananas, coconuts, hides, tortoise shell, cacao and *lagua* (vegetable ivory). All international commerce moves through Cristobal and Balboa, Bocas del Toro being reserved for local business. The Panama railway across the Isthmus, 47 m. long, is U.S. property. The United Fruit Co. has 150 m. of banana railway in Bocas del Toro province, running to Limón in Costa Rica. Only a small part of the territory is occupied, and little is under cultivation. The only highly organized industry is the banana business of the United Fruit Co., which exports over \$2,000,000 worth of bananas yearly. In 1906 cattle numbered 65,000; in 1916, 200,000; there were then also 15,000 horses, 2,000 mules, 30,000 hogs, and 5,000 goats. Coffee grows in Chiriqui province, and in Coclé province a concern of German origin has raised cacao, coffee and rubber since 1895. Tobacco and sugar are increasing; the first sugar exported to the United States was in 1920. Other crops are corn, rice, yams and ivory nuts. The tropical woods of the forests are exported, as are medicinal plants. The pearl fisheries are famous. Metals are scantily represented. The Sinclair Oil Corp. of New York has concessions on Columbus I., and has drilled wells at Bocas del Toro.

History.—The successful candidate of 1908 for the four-year presidential term, Domingo de Obaldia, died in 1910, and Pablo Arosemena completed his term. In 1912 Belisario Porras, a Liberal, was elected. Ramon M. Valdez was elected in June 1916 amid riots and intervention by the United States. He died in 1918, and Ciro L. Urriola completed his term. Ernesto Lefevre was inaugurated Jan. 30 1920, but Belisario Porras soon succeeded him, being elected in Aug. of the same year, and inaugurated Nov. 1 for a four-year term. There are three vice-presidents (*designados*), and a Cabinet of five members. The constitution

was amended Dec. 26 1918 so as to provide for a Chamber of members, one for each 10,000 inhabitants. The president chosen by direct vote, and is ineligible to succeed himself. Beginning in 1924 deputies of the Chamber are to be chosen by direct vote. Provincial governors became elective in 1902. Capital punishment is prohibited. Foreigners may not ming in politics, and may be ejected for criticizing public officers institutions. The independence of the republic was recognized by Colombia April 6 1914 by a treaty between the latter and the United States, ratified by Colombia in the same year and by the U.S. Senate April 20 1921. Panama ratified the Treaty of Versailles Jan. 8 1920, and is an original member of the League of Nations.

Boundary Dispute.—The constitution of Colombia of 1886 declared that its boundary with Costa Rica should be that which had existed between the viceroyalty of Nueva Granada and the captaincy-general of Guatemala in 1810, but that boundary line might be located by treaties which might be negotiated without reference to the *uti possidetis* of that year. Colombia and Costa Rica endeavoured, by treaties negotiated in 1825, 1856, 1865 and 1876, to fix the line without success. In 1876 arbitration was agreed on, and Alfonso XII., King of Spain, was asked in 1888 to make an award, but he died before doing so. It was agreed in a treaty of Dec. 25 1880 that the arbitral award must lie within the specified limits of the conflicting claims. This provision was included in a treaty made at Paris dated Jan. 20 1886, and in another made at Bogotá on Nov. 4 1896. Under the last-named instrument, President Loubet of France rendered on Sept. 1 1900 an arbitral award which was accepted by Colombia and Costa Rica as final. Its demarcations were in general terms.

The state of Panama, which had been created by Nueva Granada in 1855 and made a department of Colombia in 1886 became independent on Nov. 3 1904, at which time it inherited the boundary controversy with Costa Rica. The Loubet line had not been made effective because of Colombian revolutions. On March 7 1905 Costa Rica and Panama by convention adopted a line interpretative of the Loubet award, but Costa Rica still considered the award unfair to her in respect of the valleys of the tributaries of the Sixaola river above the Yoruquin. In fact, the treaty gave to each republic *de facto* right over territory belonging *de jure* to the other. Costa Rica considered, because of interpretations of the Loubet award by Panama, that the treaty of 1905 had lapsed, Panama not having ratified it. Through the good offices of the United States, which was interested in American land claims in the Sixaola region, the two republics agreed in 1910 to submit the Loubet award, which both had accepted, to the interpretation of Chief Justice White of the U.S. Supreme Court. In 1914 he rendered a decision adverse to Panama, and the latter refused to accept it, claiming that it went beyond interpretation, and gave territory not asked for to Costa Rica.

On Feb. 21 1921 Costa Rica forces seized Coto, in Chiriqui province, for the purpose of enforcing the White award, which favoured her there. Panama forces composed of volunteers and police at once moved to recover the territory invaded. Panama on Feb. 24 asked the good offices of the United States to prevent bloodshed. During late Feb. and early March the invasion, moving toward Bocas del Toro, was marked by light engagements and there were anti-American disorders in Panama. On March 5 President Harding requested both nations to cease hostilities and provide for an agreement based on the White award. They acceded, and on March 9 an armistice was announced. Panama had reiterated her dissatisfaction with the White award, and had made representations to the League of Nations denouncing the invasion of her territory by a fellow-member of the League. While withdrawing her military forces from Coto, as Costa Rica had done, Panama announced that she was leaving civil and police forces, and would demand reparation from Costa Rica. The U.S. Government insisted that Panama should acquiesce to the terms of the White award.

(H. J. P.)

PANAMA CANAL (see 20.666).—The construction period of the Panama Canal covered about 10 years, but the actual work of

construction was accomplished in about seven years. The first three years were devoted mainly to the task of getting ready to work. During that time the thorough sanitation of the Canal Zone was accomplished, yellow fever was permanently banished, an operating plant was assembled, a working force gathered, living quarters erected and a food supply provided. Reservoirs were built which furnished an ample supply of pure water to the canal force, and to the cities of Colon and Panama, in which water and sewer-systems were built. An out-of-date railway-system was converted into an adequate one with a thoroughly modern equipment of rails, locomotives and cars. The first commission was in office only a year (1904-5) and accomplished little beyond formulating plans and ordering necessary supplies. The second, under the expert direction of John F. Stevens as chief engineer and afterwards as chairman also, reconstructed the railway-system, assembled the operating plant, collected an efficient working force and provided for it quarters, food and all necessary supplies. It also constructed wharves and docks at both terminals, and machine-shops in which the locomotives, cars, steam-shovels and other elements of the operating plant, which were shipped in parts from the United States, were put together. President Roosevelt paid a visit of three days to the Isthmus in Nov. 1906, inspecting the canal works at all points. His visit was notable as the first instance in which an American president had passed out of the U.S. territory while in office. Col. Goethals, of the Engineer Corps of the U.S. army, was appointed chairman and chief engineer of the third commission on the resignation of Mr. Stevens, and entered upon his duties April 1 1907. This commission was composed of four army engineers, one navy engineer and two civilians. It had been in office only a few months when President Roosevelt, who had from the outset of the work been convinced that the best results could not be attained through an executive body of seven members, issued an executive order placing supreme power in the hands of Col. Goethals, abolishing the commission as an executive body, and making its members, who were heads of departments, subordinate to him. By this order Col. Goethals became the absolute autocrat of the Canal Zone, holding in his hands all civil, military and other powers. For issuing the order President Roosevelt was sharply criticized in Congress, on the ground that he had exceeded the authority conferred upon him by law, but his course was subsequently approved in the Act of 1912 for the government and operation of the canal after its completion.

Excavation and "Slides."—Through the power thus given him, Col. Goethals pressed the work of construction forward with such vigour during the five years following the issue of the order that during that period nearly 75% of the entire excavation of the canal was accomplished. The original plans of the canal contemplated a channel with a bottom-width of 200 ft. through the nine m. of the Culebra (afterwards called Gaillard) Cut section and estimated the excavation in the Cut at 54,000,000 cub. yd., and that of the entire canal at 95,000,000 cub. yards. The entire cost of construction, exclusive of \$40,000,000 paid to the French Canal Co., \$10,000,000 paid to the Panama Republic, and the cost of sanitation and civil administration, was placed at about \$190,000,000. The original plans also provided for locks 900 ft. long and 100 ft. wide. In 1906 President Roosevelt increased the length to 1,000 ft. and in 1908 the Canal Commission recommended and President Roosevelt approved changes in the plans which increased the bottom-width of the Cut channel to 300 ft. and the width of the locks to 110 feet. These and other changes increased the estimate of total excavation to nearly 175,000,000 cub. yd. and the estimate of total cost, including payments to the French Canal Co. and to the republic of Panama, to \$375,210,000. In this estimated excavation there was included an allowance of about 8,000,000 cub. yd. for "slides" or breaks in the walls of the Cut. These had been active during the French operations, and had begun to be troublesome to the Americans in the wet season of 1905. In Oct. 1907 a movement occurred which carried about 500,000 cub. yd. into the canal prism, completely filling it and stopping the movement of dirt trains for a month. In Jan. 1913 another movement occurred carrying about 2,500,000 cub. yd. into the prism. One in Feb. 1920 carried in about 2,000,000 cub. yd. more. During the period of construction and subsequently there were about 30 slides of different kinds, covering an area aggregating 220 ac., and compelling an additional excavation of about 30,000,000 cub. yards. Because of this and other developments, revised estimates of the total excavation were made in 1912, 1913 and 1914, the last one placing it at nearly 240,000,000 cub. yd., or about 65,

000,000 more than the amount on which the estimated cost of \$375,000,000 had been based. When the canal was thrown open to commercial traffic on Aug. 14 1914, a total of 224,000,000 cub. yd. had been excavated, and when it was declared formally completed and opened by President Wilson July 12 1920, a total of about 240,000,000 cub. yd. had been excavated and yet the total cost of the canal up to that date was only \$366,650,000, exclusive of expenditures for its military and naval defence. The excavation of slides alone cost about \$10,000,000.

Gatun Dam.—The Panama Canal is a huge water bridge rather than a canal, for its surface for the greater part of its length is 85 ft. above sea-level and is held in place by dams at either end. Of these dams the largest and most important is that at Gatun on the Atlantic side. It spans the northern and lower end of a deep valley through which the Chagres river formerly flowed to the sea. It is nearly 1½ m. long measured on its crest, nearly half a mile wide at the base, about 400 ft. wide at the water surface, about 100 ft. wide at the top; and its crest is at an elevation of 105 ft. above sea-level. It is really two dams in one, for in its centre there is a natural hill of rock about 110 ft. in height. In this the spillway of the dam is constructed, and against its two sides rest the two sections of the great dam. The dam itself contains about 21,000,000 cub. yd. of material. Its outer portions are composed of rock and earth, mainly from the Cut, and its centre or core of material drawn by hydraulic process from pits above and below the dam. This material is a natural mixture of sand and clay which in a watery condition flowed into the interstices of the rock and clay of the structure, making the whole at the centre a rubble-wall firmly cemented together and thoroughly impervious to water. Of the entire length of the dam only 500 ft. are exposed to the maximum waterhead of the lake, which is 85 to 87 feet. In 1919, after an exceptionally light rainfall, the maximum level of the lake was 87-16 ft. in Dec.; and in May 1920, 81-65 feet. The spillway is a concrete-lined channel, 1,200 ft. long and 285 ft. wide, the bottom being 10 ft. above sea-level, sloping to sea-level at the lower end. Across the lake-opening of the channel is a concrete dam in the form of an arc of a circle, making its length 805 ft., although it closes a channel with a width of only 285 feet. The crest of this dam is 69 ft. above sea-level, or 16 ft. below the normal level of the lake. On the crest are 13 concrete piers with their tops 115-5 ft. above sea-level and between these are regulating gates of the Stoney type which move up and down on roller trains in niches in the piers. The gates permit a discharge of water greater than the maximum known discharge of the Chagres river during a flood. Near the N. wall of the spillway is a hydro-electric station capable of generating, through turbines which are supplied with water from the lake through a fore-bay, sufficient electricity to meet all demands, including the lighting of the canal and all Canal Zone towns and buildings; the machinery of the locks, the machine shops, dry-dock and coal-handling plant; and the telephone and telegraph systems. There is an emergency electric plant at Pedro Miguel, operated by steam.

Dams on the Pacific Side.—Dams much smaller than that at Gatun were erected on the Pacific side, one with one lock at Pedro Miguel and one with two locks at Miraflores. In both instances the lock structures themselves form the main portion of the dam. That at Pedro Miguel maintains the level of the water in Gatun Lake and in Culebra Cut, and is placed at the lower or southern end of the channel through the Cut. That at Miraflores holds back the water of a small lake which furnishes the supply of the locks at that point. The Pacific dams are constructed in part like that at Gatun and in part of concrete. That at Miraflores has a small spillway in it.

The Locks.—All locks of the canal are in duplicate, are constructed in the same manner, and their chambers, with walls and floors of concrete, have the same usable dimensions—1,000 ft. long and 110 ft. wide. There are six pairs, making 12 in all. The side walls are from 45 to 50 ft. wide at the surface of the floor, are vertical on the chamber side, and narrowed on the outside from a point 24½ ft. from the floor, by means of a series of steps each 6 ft. long, to a width of 8 ft. at the top. A culvert 254 sq. ft. in area of cross-section, about the area of the Hudson river tunnels of the Pennsylvania railway, extends the entire length of each middle and side wall, and from each of these large culverts, smaller culverts, 33 to 44 sq. ft. in area, extend under the holes in the floors. Fifteen ft. above the top of the culvert in the middle wall there is a space much like the letter U in shape, 19 ft. in width at the bottom and 44 ft. at the top. This space is divided into three storeys or galleries: the lowest for drainage; the middle for wires that carry the electric current to operate the gates and valve machinery installed in the centre wall; and the upper a passage-way for the operators. All lock walls are approximately 81 ft. high, except in the lower pair of locks at Miraflores, where they are 82 ft. to meet the requirements of the extreme tidal oscillation of about 21 ft. in the Bay of Panama. In the walls at Gatun there are about 2,000,000 cub. yd. of concrete, and in those on the Pacific side about 2,400,000 cub. yards. All lock walls rest on rock foundations. The approach wall at the N. entrance at Gatun, 1,031 ft. long, rests upon piles driven from 35 to 70 ft. into the earth; that at the S. or lake entrance, 1,009 ft. long, rests on piles reaching to rock, in some places over 100 ft. below sea-level. Cellular form of reinforced concrete is used in all approach walls except those of the lower locks at Gatun and Miraflores where mass concrete is used because of the effect of salt water on steel reinforcement.

Lock Gates.—The lock gates, each composed of two leaves, are 65 ft. wide, from 47 to 82 ft. high, 7 ft. thick and weigh from 300 to 730 tons. There are 92 leaves in all and their combined weight is 60,000 tons. They were carried in parts to the Isthmus and put together there. They are constructed to float like a ship. Each is a huge webbed steel box, the girders of which are covered with a steel sheathing. All portions of the interior are accessible, with watertight compartments providing for the adjustment of the buoyancy so as to control within limits the dead load on the bearings, making the leaf practically float in the water. This watertight compartment is subdivided vertically into three sections, each independently watertight, so that if the shell should be broken in any way, or begin to leak, probably only one section would be affected. An air-shaft, 26 in. in diameter, runs from the bottom compartment up to the top of the gate, and this also is watertight where it passes through the upper half of the leaf. The girders are made with manholes through the webs, providing communication from the top to the bottom of the leaf, and are connected by several sets of vertical transverse diaphragms of solid plates, running from top to bottom of the leaf, thus making a cellular construction, and dividing the spaces between the horizontal girders into small pockets, all of which are accessible through manholes. Each leaf rests at the bottom of its heel-post upon a hemispherical pivot of forged nickel steel, and is hinged at the top to the masonry of the lock wall. It swings free on the pivot like a door, without wheels or other support beneath it. Intermediate gates are used in all except one pair of locks, and are so placed as to divide the space into two chambers, one 600 and the other 400 ft. in length. This makes possible a saving of water and time in locking small vessels through, for about 95% of the vessels navigating the high seas are less than 600 ft. in length. The highest gates and the highest lock walls on the canal are those of the lower locks at Miraflores, and these locks are the only ones which have no intermediate gates. The total lift from mean sea-level to the level of Miraflores lake, 54½ ft., is divided equally between the upper and lower locks. The depth of water on the mitre sills is 40 feet. The locks are filled and emptied through the large and smaller culverts. The large culverts are controlled at points near the gates by large valves, and each of the small culverts feeds in both directions through the laterals, thus permitting the passage of water from one twin lock to another, effecting a saving of water if desired. The average time in filling and emptying a lock is about 15 minutes. The time to pass a vessel through all the locks is about two hours, one hour at each end of the canal. The time of passage of a vessel from ocean to ocean is from 8 to 10 hours, according to the ship's size and speed.

Passage of Locks.—No vessel is permitted to enter or pass through the locks under its own power. On arrival at Gatun or Miraflores, it is tied up to the approach wall and turned over to the absolute control of the canal authorities. These place a representative of their own on the bridge and another in the engine-room. They then connect the towing locomotives, or "electric mules," with the ship. These locomotives operate on cog tracks on the lock walls, and proceed at the rate of 2 m. an hour. The number of locomotives varies with the size of the vessel. The usual number required is four: two ahead, one on each wall, imparting motion to the vessel; and two astern, one on each wall, to aid in keeping the vessel in a central position and to bring it to rest when entirely within the lock chamber. They are equipped with a slip drum, towing windlass and hawser, which permit the towing-line to be taken in or paid out without actual motion of the locomotive on the track. The locomotives run on a level, except when in passing from one lock to another they climb heavy grades. Before a lock can be entered, a fender chain, stretched across the walls of the approach, must be passed. If all is proceeding properly, this chain is dropped into its groove to the bottom of the channel. If by any chance the ship is moving too rapidly for safety, the chain remains stretched and the vessel runs against it. The chain, which is operated by hydraulic machinery in the walls, then pays out slowly by automatic release until the vessel is brought to a stop. The chain, which weighs 24,008 lb., and is stronger than any previously made, is capable of stopping a 10,000-ton ship running at 4 m. an hour within 73 ft., or less than the distance between the chain and the first gate. If the vessel by a remote possibility gets away from the towing locomotives and, breaking through the chain, rams the first gate, there is a second gate 50 ft. away, protecting the lock, which is certain to arrest further advance. When the leaves of this gate swing open, the vessel is towed in, and the gate is closed behind it. Then, from openings placed at regular intervals in the lock floor, water pours in, lifting the vessel to the level of the lock above. This inflow, coming equally from all points, does not move the ship from a stable position. The gates are never opened or closed with a head of water on either side of them. The process of lifting is repeated until the vessel reaches the lake level. At all times the vessel is in full view of the men who are controlling it and as safe as if tied to a wharf. The gates are opened and closed by a powerful machine invented by Edward Schildhauer, an electrical engineer in the employ of the Goethals Canal Commission. It consists of a crank gear or wheel moving through an arc of 197°, placed horizontally in the lock wall. To the outer rim of the wheel is attached a strut or connecting-rod which is fastened to the top of a lock gate 17 ft. from the pintle or hinge. When the wheel turns in either direction the gate leaf is opened or shut, the operation taking two minutes.

The crank gear, constructed of cast steel, is 19 ft. 2 in. in diam and weighs approximately 35,000 pounds. It is connected with electric motor, and a small electric switch sets it in motion. Every operation in the passage of a vessel through the lock, except movements of the towing locomotives, is controlled by a single man so placed in a building at the top of the centre wall as to command an unobstructed view of every part of the locks. He has before him a control board table about 64 ft. long and 5½ ft. wide which is a complete model of the locks in duplicate with switches and indicators in the same relative positions the machines they control occupy in the lock walls. Standing by this board the operator throws the electric switches, and in response to his action he sees in the model the fenders rise and fall, the gates open and close, the water rise and fall in the locks, and knows the exact position of the vessel at every step of its progress. Each gate, each valve for letting in the water to the culverts, each fender chain, is operated by a separate motor mounted near the machinery in chambers in the lock wall. In each machine chamber there is a starting panel containing contractors by which current is applied to the motor, and these panels in turn are controlled from a main unit in the central control-house. Some of the machine chambers at Gatun are 2,700 ft. distant from the point of control, 90 of them are within 2,000 ft., and 50% within 1,200 feet.

The Canal Voyage.—The length of the canal from shore-line to shore-line is about 40 m. and from deep water in the Atlantic to deep water in the Pacific about 50 miles. The canal does not, as is generally supposed, cross the Isthmus from E. to W. It runs due S. from its entrance in Limon Bay, through the Gatun locks to a point in the widest portion of Gatun lake, a distance of about 11½ m.; it then turns sharply toward the E. and follows a course generally south-eastern till it reaches the Bay of Panama. Its terminus near Panama is about 22½ m. E. of its terminus near Colon. In passing from the Atlantic to the Pacific a vessel enters the approach channel in Limon Bay, which has a bottom width of 500 ft. and extends to Gatun a distance of seven miles. At Gatun it enters a series of three locks in flight which lift it 85 feet. It then enters upon Gatun lake, the water bridge of the Isthmus. The lake covers an area of 164 sq. m. with depth varying from 45 to 87 ft., and contains 183,000,000 cu. ft. of water. It has a channel varying from 500 to 1,000 ft. in width, for a distance of about 24 m. to Bas Obispo, where the Cut passage begins. Through the lake a vessel may steam at full speed. The channel through the Cut, a distance of about nine m., has a bottom width of 300 ft. and a depth of 45 ft., and extends to the locks at Pedro Miguel, the Pacific end of the water-bridge. At Pedro Miguel the vessel is lowered in the single lock 30½ ft. to a small lake, at an elevation of 54½ ft. above sea-level, through which the vessel passes, 1 m. to the two locks at Miraflores. These drop it to sea-level, and through an approach passage 8½ m. long, with a bottom width of 500 ft., it passes into the Pacific. The Cut has eight angles and at these the channel is widened sufficiently to allow a 1,000-ft. vessel to make the turn. The smallest angle is 70° 36' and the largest 30°. In the whole canal there are 22 angles, the total curvature being 600° 51'. The sharpest curve is 67° 10'. The canal is lighted from end to end by electricity and gas. There are concrete lighthouses for range lights on the hillsides, and beacons in the Cut, in which electricity is used. The channel through Gatun lake is marked with floating buoys lighted with compressed acetylene dissolved in acetone. The most powerful electric lights are those of the approach channels which are visible for from 12 to 18 nautical miles. The beacons and gas-buoy lights have about 850 candle-power. White lights are used throughout; and in order to eliminate the possibility of confusing the lights with one another, and with the lights on shore, all range-lights, beacons and buoys have individual characteristics, formed by flashes and combinations of flashes of light and dark intervals. The electric lights on the locks are suspended from brackets on concrete columns about 34 ft. high and are clustered under concrete hoods in such a way as to light the lock chambers and not penetrate along the axis of the canal.

Breakwaters.—Long breakwaters have been constructed near the approach channels in both oceans. One in Limon Bay, or Colon harbour, called the West Breakwater, extends into the bay from Toro Point at an angle of 42° 53' northward from a base-line drawn from Toro Point to Colon light, and is 11,526 ft. in length, 15 ft. wide at the top and 10 ft. above mean sea-level. A second, also in Limon Bay, known as the East Breakwater, is without land connexion, is about one m. in length and runs in an easterly direction at nearly a right-angle with the canal channel. It has a lighthouse on the channel end. The purpose of the West Breakwater is to protect the harbour against "northerly," very severe gales which are likely to blow from Oct. to January. The purpose of the East Breakwater is to prevent silting in the canal channel. The breakwater at the Pacific entrance extends from Balboa to Naos Is., a distance of about 17,000 ft., or a little more than three miles. It lies from 900 to 2,700 ft. E. of, and for the greater part of the distance nearly parallel to, the axis of the canal prism, varies from 20 to 40 ft. in height above mean sea-level, and is from 50 to 3,000 ft. wide at the top. It was constructed for a twofold purpose; first, to divert cross-currents that would carry soft material from the shallow harbour of Panama into the canal channel; second, to furnish rail connexion between the islands and the mainland.

Permanent Canal Buildings.—All permanent canal buildings, for civil or military use, are of concrete, replacing the temporary struc-

tures which were of wood. The headquarters of the canal force are in the large three-storey administration building, situated on a bluff about 75 ft. above sea-level and overlooking the Pacific entrance to the canal. Near this are the governor's residence and the dwellings of the other officials. On the plain below, which was formerly a swamp and was raised to an elevation of 20 ft. above sea-level by material from the Cut and hydraulic fill from excavation for terminal structures at Balboa, there is a town composed of concrete buildings erected after the canal had been completed. The buildings are arranged on either side of a central avenue. They include dwellings for different types of employees, a police station, post-office, fire station, chief sanitary office, dispensary, telephone building, clubhouse, hotel, lodge hall, schoolhouse and playground, church and commissary. All are of concrete blocks with roofs of red tiles, and of the same general style of architecture, and are connected with one another by a continuous arcade as protection against sun and rain.

Terminal Facilities.—In both oceans have been constructed terminal facilities adequate for the naval, military and commercial needs of the United States and attractive to the shipping of the world. Systems of concrete piers 1,000 ft. in length, with docks and wharves and sheds of concrete, have been built. On the Pacific side is a concrete dry-dock on a rock foundation, with a usable length of 1,000 ft. and an entrance width of 110 ft., and a subsidiary dock for vessels of a smaller type with a usable length of 350 ft. and an entrance width of 80 feet. There are also large repair shops of ample capacity to meet all demands. Dry-docks and machine shops are situated behind Sosa Hill and thus protected against naval bombardment. Basins of concrete for the storage of coal have been constructed below the water-line on both oceans, some of which are available for leasing to private coal companies, all handling to be done by the U.S. Government plant. A fixed supply of coal for the United States naval use is maintained. From a single plant supplies of oil, food and other necessities are furnished to all vessels desiring them, as well as to the canal forces. A high-power wireless telegraph station is situated midway of the Isthmus, under the jurisdiction of the Navy Department, but open to the public under Government regulations.

Fortifications and Military Occupation.—The Canal Zone is a military reservation by Act of Congress. Fortifications have been built in the oceans at both ends of the canal, and a military force of about 10,000 men is maintained. Concrete barracks have been erected at both terminals, and adjoining the locks.

Canal Administration.—Under an Act of Congress, approved Aug. 24, 1912, the Panama Canal is governed and operated and the Canal Zone is governed through a governor of the Panama Canal, appointed by the president, with the advice and consent of the Senate, for a term of four years, and until his successor shall be appointed and qualified, at a salary of \$10,000 a year. In addition to the operation of the canal, the governor has official control and jurisdiction over the Canal Zone and performs all duties in connexion with its civil government, it being held, treated and governed as an adjunct to the canal. There is one U.S. District Court in the Canal Zone, with the same jurisdiction and procedure as the same courts in the United States, the judge of which is appointed by the president. Appeals are made to the Circuit Court of Appeals of the Fifth Circuit of the United States. In each town there is a magistrate's court, the judges being appointed by the governor. They have jurisdiction only within their towns and over minor cases. General Goethals was the first governor and served till Jan. 11, 1917, when he resigned and was succeeded by Col. Chester Harding, U.S.A., who held the office till Jan. 11, 1921, when he was succeeded by Col. Jay J. Morrow, U.S.A.

Canal Zone Population.—A census of the Canal Zone, taken in 1920, showed a total pop. of about 30,000 of which 21,650 were civilians and the remainder military. There were 3,434 male and 360 female American citizens; 5,652 male and 74 female aliens; the remaining 12,000 were mainly natives and transient West Indians.

Canal Force.—The average working force of the canal was in 1920 about 21,000, of which about 3,500 were Americans, chiefly in official and clerical positions, and the others alien labourers, mainly West Indian negroes. The apparent discrepancy between these figures and those of the Canal Zone census is due to the fact that many of the labourers live in the cities of Panama and Colon, which are not within the Canal Zone.

Tolls.—The Hay-Pauncefote treaty between Great Britain and the United States, abrogating and succeeding the Clayton-Bulwer treaty, was ratified on Dec. 16, 1901. It contained this clause:—

"The canal shall be free and open to the vessels of commerce and of war of all nations observing these rules, on terms of entire equality, so that there shall be no discrimination against any such nation, or its citizens or subjects, in respect of the conditions or charges of traffic or otherwise. Such conditions and charges of traffic shall be just and equitable."

In 1912 Congress passed an Act for the operation and government of the Panama Canal, which was approved by President Taft on Aug. 24 of that year, and which contained the provision that "no tolls shall be levied upon vessels engaged in the coastwise trade of the United States." A formal protest against this exemption was made by Great Britain on the ground that it was a violation of the Hay-Pauncefote treaty. In June 1914, under a special appeal from

President Wilson, Congress passed a bill which repealed the Exemption Act of 1912. This was approved by President Wilson on June 15, 1914. Under authority given to him by the Panama Canal Act of Aug. 24, 1912, President Wilson issued a proclamation on Nov. 21, 1913, fixing the canal tolls at \$1.20 per net ton of net capacity as determined by the United States national rules of measurement. On Feb. 15, 1915 President Wilson issued supplementary instructions that where application of the \$1.20-per-net-ton rate produced a sum in excess of the sum produced by the application of the \$1.25 rate on net registered tonnage as determined by the United States rules of measurement, the excess amount should be uncollectable. The effect of this ruling was to reduce by approximately 14% the revenue from tolls paid by ships of all nationalities using the canal. During the first six years of operation there was a marked increase in traffic through the canal notwithstanding the fact that the World War everywhere prevented the normal development of ocean commerce. After the entry of the United States into the war there was a decrease in commercial traffic, due to the diversion of lines of ships to trans-Atlantic service, which was more than offset by the increase in traffic growing out of the war, chiefly on account of the development of the nitrate trade with the Pacific and South America.

Canal Traffic.—The number of commercial transits received from tolls and other collections, and the cost of maintenance and operation for the fiscal years 1915–20 are shown in the following table:—

Fiscal Year	Number of commercial transits	Tolls and other revenues	Cost of maintenance and operation
1915 . . .	1,072	\$4,343,383.69	\$4,175,000.00
1916 . . .	760	2,558,542.38	6,900,000.00
1917 . . .	1,806	5,808,398.70	6,785,000.00
1918 . . .	2,068	6,411,843.28	5,920,342.94
1919 . . .	2,028	6,354,016.98	6,112,194.77
1920 . . .	2,478	8,035,871.57	6,548,272.43

For the same period the number of canal transits by government vessels exempted from tolls and the total tonnage of cargo carried were as follows for each fiscal year:—

Fiscal Year	Number of Vessels	Cargo Tons	Fiscal Year	Number of Vessels	Cargo Tons
1915 . . .	16	43,647	1918 . . .	112	36,746
1916 . . .	43	76,675	1919 . . .	179	93,641
1917 . . .	100	147,405	1920 . . .	267	351,332

Over 25% of the cargo handled through the canal, from its opening to the end of the fiscal year 1920, was in transit between the United States and South America, and 14% was between the Atlantic coast of the United States and the Orient. Among nations the chief users of the canal were the United States and Great Britain. The number of vessels passed each year for these nations and for all other nations was as follows:—

Fiscal Year	United States	Great Britain	All other nations
1915 . . .	470	465	153
1916 . . .	238	358	191
1917 . . .	464	780	632
1918 . . .	628	699	803
1919 . . .	786	602	637
1920 . . .	1,129	753	596

The following is the saving, in nautical miles, effected by the Panama Canal from European ports to ports on the W. coast of America, to Hawaii and to New Zealand.

PAN-AMERICAN CONFERENCES (see 20.671).—The fourth Pan-American Conference was held July 12–Aug. 30 1910 in Buenos Aires. Many questions involving the common interests and of the American republics were discussed, including steamship service, sanitation, copyright, patents and trade marks. It was decided that the International Bureau of the American Republics should henceforth be called the Pan-American Union. The same year the Pan-American Union building in Washington was dedicated; it had been erected through a gift of \$750,000 from Andrew Carnegie and additional funds provided by the various republics. During the three weeks following Dec. 25 1915 the second Pan-American Scientific Congress met in Washington. Eduardo Suarez, Chilean ambassador to the United States, presided. Among the speakers was President Wilson, who urged friendly settlement of international disputes by arbitration. The Congress appointed an International High Commission, which met at Buenos Aires in April 1916. Improvement and extension of cable, telegraph and railway service between the countries was urged. A permanent International High Commission was established to promote uniform commercial laws throughout Pan-America. In Nov. 1918 a Pan-American Federation of Labor Conference met at Laredo, Tex. Delegates were present from the United States, Mexico and Central America. An influenza epidemic interfered with South American attendance, Colombia alone being represented. A permanent federation was organized. Pan-American Child Welfare Congresses met at Montevideo, Uruguay, in Dec. 1918 and in May 1919; at the second meeting provisions were made for establishing at Montevideo an International Bureau of Child Welfare. In June 1919 a Pan-American Commercial Congress was held in Washington, and in the same city in Jan. 1920 a Pan-American Financial Congress.

PAN-ISLAMISM.—One of the results of the World War was to bring into new prominence, in connexion with Turkey and the Middle East, the movement known as Pan-Islamism, for uniting the peoples who profess the Mahomedan religion under one banner. The history of Pan-Islamism from 1910 onwards is analyzed below.

1. *Before the Italian War.*—The proclamation of the Ottoman Constitution in 1908 seemed to cut at the root of Pan-Islamism, since the idea of the former was to substitute for preëxisting religious and national divisions an Ottoman nationality, wherein the different communities of the empire should equally share. The years of the year 1909 show many reasons why the "Young Turks" could never favour Pan-Islamism, which indeed they had officially repudiated. It was pointed out that the more conservative Moslem nations of Africa would never approve a Sultan in whose eyes all creeds were to be equal. By 1910 it was realized that this prospect was chimerical; Tal'at Bey, Minister of the

Interior, in a speech delivered at Salonika on Aug. 6 of that year at a private meeting of the Committee of Union and Progress, asserted that, though according to the Constitution all Ottoman subjects were equal before the law, such an order of things was clearly impossible; this equality was in defiance of the *Shari'ah* (religious code), and the Christians themselves had no desire to become Ottomans. At the Salonika Congress of 1911 a definite scheme of Pan-Islamic propaganda was adopted, and it was resolved that a congress of delegates from all the Moslem countries of the world ought to meet annually in Constantinople to discuss questions of interest to all Moslems. Emissaries appear to have been actually sent out during these years to win or to confirm adherents to the Ottoman Caliph wherever Moslems were subject to Europeans, even to remote parts of Africa, including Morocco; others worked among the Moslems of China. These missions seem to have been fairly effective, as a Pan-Islamic writer asserts that the *khutbah* (Friday sermon) continued to be pronounced in the name of the Ottoman Caliph in Tunis in spite of French objection; and that when, in 1912, a republic was proclaimed in China the Chinese Moslems signified their adhesion on condition that the rights of the Ottoman Caliph were not infringed thereby.

Attempts were also made to deal with the old difficulty which had confronted Pan-Islamism, the schism between Sunnah and Shi'ah. Early in 1911 a letter was published by a number of Ottoman and Persian jurists assembled at Nejeff, asserting that there was no difference of principle between the two sects and urging coöperation between the two empires, Persia being at that time, it was supposed, menaced by England and Russia. The Agha Khan, head of a sect so heretical that 'Abdul Hamid II. had declined to admit him to an audience, made a tour in India to advocate the claims of a Moslem university. Articles advocating union appeared in various Sunni and Shi'i journals; indeed, the Moslem press as a whole was Pan-Islamic.

Nevertheless, as early as 1910 prominence had been given to a new antithesis, which may be said to have ultimately wrecked the schemes for reunion of the Moslem communities. In that year the Constantinople journal *İqdam*, an organ of the Committee, adopted a tone unfriendly to the Arabs, whom it charged with readiness to sell their honour for gold—an accusation vehemently resented in the Arabic-speaking countries. But in fact the seeds of dissension between the Turkish and Arab elements in the Ottoman Empire had been sown in the Constitution, in Art. 68, par. 10 of which it is enacted that after the expiration of a period of four years a condition of eligibility to the Chamber of Deputies shall be ability to read and write Turkish. This rule definitely aimed at making Turkish the language of the empire; and in the resolutions in favour of Pan-Islamic propaganda the encouragement of the study of Turkish was recommended. The true Pan-Islamic view was that Arabic should be the common language of Islam; some, indeed, suggested that the empire should be bilingual, with Turkish for its secular and Arabic for its religious language; in any case, that every Moslem should learn Arabic in addition to any idiom which happened to be his mother tongue. Journals were started in the Turkish and Arabic interests respectively; the latter were represented in Constantinople by one called at first *Sirat Mustaqim*, afterwards *Sabil al-Rashad*. The Committee of Union and Progress more and more inclined to the Turkish side and to the substitution of Pan-Turanianism for the Ottoman nationality. In the races subject to the Russian Empire and speaking different varieties of Turkish they found their natural allies; and for these the Ottoman literature could count as classical, being in any case far superior to anything of their own. This policy of Turkification involved the Committee in wars in Albania, the Hauran and S. Arabia; they planned treating the Arab parts of the empire as colonies, to be ruled from Constantinople without the right of sending deputies to the Chamber; and they were charged with the design of disarming all Moslems in the empire except the Turks, and with advocating neglect of the ritual of Islam. Where military exercises interfered with religious the latter were to give way; devout officers were, it is said, dismissed and replaced by free-thinkers.

2. *The Italian War.*—To some extent this split was retarded by European aggression, which may be said to have culminated in 1911. The interference of Great Britain and Russia in Persia and the French scheme for governing Morocco as a protectorate had made it clear that Turkey was the only Islamic state which could compete with the European Powers on anything like equal terms. The Italian attack on Tripoli in Sept. of that year evoked widespread sympathy with Turkey among the Islamic communities. The Javanese press, e.g., made no secret of its desire to see Turkey triumph, and the Mahommedan press of Egypt warmly espoused the side of Turkey. At a meeting held in Kabul the Amir of Afghanistan took part in a demonstration in favour of the Turks, and in India money was collected for their assistance. Care, indeed, had been taken by Italy to avoid all appearance of an attack on Islam itself, and the Pope himself warned Christian soldiers against considering the campaign as a crusade; but to the Moslem, Christian and European are not very clearly distinguished, and it was plausibly argued that Europe was not now satisfied with protecting Christians within the Ottoman Empire, but had resolved on partitioning that empire among non-Moslem Powers. In proclamations issued in Constantinople the Sultan whose dominions were thus attacked was described as the legitimate ruler of 300 million Moslems (swelled by some journalist to 400 million), and a demand was raised for the restoration of his arbitrary powers.

Islam was not united on this occasion in the defence of the Ottoman Caliph, for while the Imam of San'a ceased hostilities, the Idrisi chieftain in Asir favoured the Italians. On the other hand, the Turks had the co-operation of the Senussis, who in the preceding century had kept aloof from their quarrels. The Committee of Union and Progress is said to have been astonished at the amount of sympathy which the cause of Turkey had evoked, having expected, e.g., that the Tripolitans would be indifferent to the change of rule, whereas they in fact stubbornly resisted the invaders. The Committee in consequence proceeded to make certain concessions to Arab sentiment, without, it is said, actually altering their policy. A beneficent Islamic society was founded in Constantinople, under the patronage of the heir apparent, chiefly with Egyptian money; and an attempt was made to found a Moslem university in Medina. Schemes were started for promoting the study of Arabic under efficient instructors; and there were authoritative pronouncements that racial differences in the Ottoman Empire need not be suppressed.

3. *The Balkan War and its Consequences.*—This war, which broke out in Oct. 1912, demonstrated the military weakness of Turkey, though the recovery of Adrianople after the Armistice was greeted with telegrams of congratulation from all parts of the Moslem world. Clearly, however, up to this point Pan-Islamism had failed in its original design, that of arresting the progress of European aggression and eventually restoring Islamic rule in Asia and Africa. It had, however, aroused fairly general sympathy with Turkey and perhaps brought home to many Moslems the idea that someone claiming to be their Caliph existed. Subscriptions to the national defence fund of the Ottoman Empire flowed in from various quarters; owing to the efforts of a deputy of the Duma, ~~the~~ ^{the} ~~pula~~ ^{Abdul} ~~Abdul~~ ^{Jalil} ~~Oghlu~~, the Moslems of Samarkand sent a handsome subscription in Aug. 1913; and in Bosnia, which had quite lately formed part of the empire, the opinion was said to be general that the ruin of Turkey would be an immense disaster from the religious point of view. From this region, too, sums of money were sent to the Red Crescent and the national defence fund. In May the Moslems of Delhi sent the sum of £1,600 to the Ottoman Minister of Finance for the housing of immigrants who had lost their homes in the recent war. Subscriptions were also promised from Java and the Malay States. The talk about the need for union between Moslems was renewed in the Moslem press throughout the world; notably in the *Habl al-Matin*, a Pan-Islamic journal in the Persian language published in Calcutta; and societies with the object of either spreading Islam or producing unity among Moslems were founded in different regions; e.g. a *jam'iyyat al-ittifaq*, "Society of Concord," founded in Muscat, a *khariji* state. An *anjuman-*

i-himaya-i-Islam, "Society for the Defence of Islam," of Auckland, California, is also mentioned.

The language used by journalists caused some apprehension to the European governments responsible for great numbers of Moslems, and complaints were made that in the Islamic territories of Russia the charge of Pan-Islamism was easily leveled and resulted in frustrating the efforts that were being made for spreading education. The Islamic reactionaries, who dreaded the modern learning, obtained the imprisonment of modernist teachers by informing the authorities that the latter were engaged in Pan-Islamic propaganda. Any Moslem who took in the journals of Cairo or Constantinople, or had studied in either of those cities, was suspected of pursuing these schemes. On the other hand, the plan pursued by the imperial government in its scheme for enforced education was the Russification of all its subjects. One member of the Duma, Sadr ad Din Maqsudoff, had some years before defended his co-religionists from the charge of Pan-Islamism which the Moslem schemes for education had incurred; while claiming that the Russian Moslems were loyal to the Government, he maintained that their nationality was Islam.

In Syria and Mesopotamia nationalism at this time was developing, and Pan-Islamism making little way.

Two works issued in Constantinople in the year 1913 illustrate the ideas of Moslem publicists on the phase which the question had now assumed.

One of these is the *Ittihad al-Islam* ("Unity of Islam" or "Pan-Islamism") of Jalal Nuri Bey, of sufficient importance to be translated into Arabic in 1920, seven years after its first appearance. In the face of the weakness displayed by Turkey in her last wars it was no longer advisable to demand a general uprising of Islamic peoples to free themselves from European oppression; hence the author, while anticipating yet further defeats and losses, substitutes for a plan of co-operation a vague hope, to which Moslems should cling. This hope is not confined to proceedings in Islamic areas.

He hopes that China and Japan will become cordial friends and so prevent the further spread of European domination in Asia; and thinks that the republican Government of China will be better for the Moslems there than the imperial Government had been. He thinks that the Arabic-speaking people of Africa and Asia will one day form a single state, without indicating what the relation of that state to the Ottoman Empire is to be; the older Pan-Islamism had on the whole favoured "decentralization," i.e., a confederation of Moslem countries under Ottoman hegemony. He advises the English to bestow on their Asiatic possessions the status of Canada or Australia, as in that case the inhabitants will co-operate cordially against their enemies.

In the matter of the sectarian divisions of Islam, which from the first have rendered Pan-Islamism impracticable, this writer's method is to some extent drastic: the minor sects in the Ottoman Empire (i.e. probably the Zeidis, Isma'ilis, Nuseiris, etc.) should be wiped out. In the case of the more important Shi'ah sect his advice is that the Moslem should forget that he is a Sunni or a Shi'i and remember only that he is a Moslem. This probably means that the Shi'is, who are in a minority, should abandon their system in favour of the other.

While asserting the superiority of Islam morally to Christianity as practised in Europe, he is anxious that European science should be adopted and its methods assimilated; and he advises the adoption of the distinction between the civil and the religious code, to the unification of which he attributes the decadence of Islam. Education should, he holds, be taken out of the hands of religious authorities and be secularized; thus mediaeval scholasticism will be abolished. What concerns the conscience should be left to religion, whereas commercial affairs should be regulated by codes which admit of improvement. These doctrines are unorthodox that his Arabic translator has occasionally to protest. They look like Pan-Islamism with the Islam.

This writer repeatedly speaks of the Moslems as a ^{single} ~~group~~, 300 million individuals attached to each other by ^{one} ~~an~~ unique strength; indeed, the phrase *Union of Islam* is tautologous, as the word Islam of itself implies ^{unity} ~~of~~.

may be the truth of this as a theory, it is confirmed neither by ancient nor by modern practice. Some writers, in general favourable to Islam, speak of dissension and civil war as unavoidable in Moslem communities; and doubtless this has led to that loss of political power which gave rise to the Pan-Islamic movement.

The work called *Qaum Jadid* ("The New Nation"), by Ubaid-alla Efendi, formerly member for Aidin, and at one time editor of an anti-Arabian journal in Arabic, which appeared about the same time, perhaps in the main advocated the same ideas, only it was far more outspoken. It demanded that every Moslem should give half his wealth to the Ottoman treasury in order to enable it to muster forces capable of recovering its lost provinces; anyone who declined to make this sacrifice was to be considered an apostate. Its idea of Islam was somewhat loose—there was no occasion to study Arabic, as the Friday sermon might be delivered in Turkish, and the Qur'an and other sacred books might be translated. The Sacred War was a duty incumbent on all Moslems, and such of them as lived contentedly under non-Moslem rulers were apostates, for by pleasing unbelievers they offended God. All Moslems in Ottoman countries who failed to enlist under the banner of the party of Union and Progress were to be regarded as apostates; as such the Albanians were to be branded. To follow the ritual prescribed in the books of the orthodox jurists was unlawful, for the new school had deduced five principles from the Qur'an. These were: 1, reason; 2, the Moslem formula of faith; 3, good character; 4, the duty of fighting with person and wealth; 5, that of striving to furnish the requisites of war by uniting under the banner of the Caliph.

Little could in fact be hoped from attempts to rouse men to make great sacrifices in the cause of Islam when all which constitutes Islam to the ordinary believer is abandoned; and Mr. Wyman Bury, in his acute analysis of the causes which militate against Pan-Islamism, gives the first place to the contempt shown by the Turks for the ordinances which Islam holds sacred. "Even before the war," he says, "Yemen Arabs talked of Turks and Moslems, a distinctly damning discrimination." The Turkish proclivity towards European dress and civilization, which he regards as another source of weakness, is scarcely to be distinguished from this, though the antithesis between civilization and its absence is to be found in other Moslem countries; and the Pan-Islamic encouragement of education as Europeans understand it, while in appearance rendering the movement formidable, has also rendered it suspect to large multitudes who would gladly emulate the ancient Islamic heroes. For the Islamic cult, which is thus so altered as to be unrecognizable, the Pan-Turanians endeavour to substitute a national ideal with a set of heroes, largely pagan, who are to displace the Prophet's family and the Four Pious Caliphs as objects of general reverence. This disrespect is naturally resented by Arab and other non-Turkish Moslems.

The former of the works described is far more characteristic than the latter of the general tone of Pan-Islamic journalism. It is full of accusations against the European Powers in control of Islamic territories, charging them with oppressing the Moslems, depriving them of elementary human rights, sowing dissension among them, and the like; yet rarely able to bring evidence justifying these charges, and compelled to ignore the fact that the Moslems prosper far more in countries protected by Europeans than where they are left to themselves. Its great hero is the Ottoman Sultan Selim I., whose chief title to fame is that he fought against and overthrew another Islamic sultanate, that of Egypt, and forcibly incorporated various Islamic countries in the Ottoman Empire. In places it is asserted that the unity of Islam is an undeniable fact wherewith Europe is confronted; in others, that the troubles of Islam are all due to its divisions. Hence the vagueness of both aim and method which characterized the earlier Pan-Islamism is conspicuous in this statement; and many a prophecy is uttered with regard to the future of European states which the years following its publication have falsified. To the latter work the term Pan-Islamism can scarcely be applied. Its programme is indeed clear enough—a general revolt of all Moslems against their European rulers in order to swell the armies of the Ottomans, the Ottomans meanwhile

practically abandoning Islam. The summing-up of the situation in Arabia by Mr. Wyman Bury in 1914 would hold good of many other Islamic lands: "The Arab still acknowledges the Sultan as Caliph, but repudiates the Ottoman Government and all its works." Some Moslems of Java threatened to abandon the *khutbah* to the Sultan if the ideas of the Turkish extremists materialized. And indeed Pan-Islamism at this stage contained no practical formula which any but Turks would adopt.

4. *Pan-Islamism during the World War (1914-1918).*—Shortly after the Turkish Empire entered the war on the side of the German alliance the Grand Mufti declared a *jihad*, summoning all Moslems to arms in defence of their faith. General Liman von Sanders asserts that this call was absolutely without response; the reason, he holds, being that the pretext was obviously false, inasmuch as Turkey was itself in alliance with non-Moslem Powers and, indeed, fighting for their benefit and under their command. He quotes an Italian minister for the statement that the call was absolutely neglected by the Moslems of Tripoli. Further, the French Government issued a counterblast in a collection of expressions of loyalty from Moslem authorities of the French African Empire (*Collection de la Revue du Monde Musulman*, 1915, 1916, called *Le Salut au Drapeau*, in the English edition *Honour to the Flag*), wherein all Moslems are called upon to fight for France. The call seems to have been issued half-heartedly, even within the Ottoman dominions. When the official at the Mosque of Damascus had to proclaim the Sacred War from its pulpit, seeing a group of German officers among the congregation he said: "I am ordered to proclaim *jihad*. A *jihad* is, as you know, a Holy War to protect our Holy Places against infidels. This being so, what are those infidel pigs doing in our mosque?" This story is told by Mr. Wyman Bury (*Pan-Islam*, 1919, p. 81), who adds: "Those who forged the blade of this counterfeit *jihad* could not temper it in the flame of religious fervour, and it shattered against the shield of religious tolerance and good faith."

Doubtless the most serious blow which the unity of Islam received during the war was the entry into it of the Sherif of Mecca on the British side in 1916. The Sherif in his proclamations (published in his organ, the *Qibla*, and reprinted in the *Manar*, vol. xix.) made it clear that his quarrel was not with the Ottoman Empire, but only with the Party of Union and Progress, who had reproduced the worst atrocities of the *Umayyads* by firing at the House of God and slaughtering worshippers. As, however, this party represented the Ottoman Government, this act produced a definite division in Islam which is unlikely ever to be repaired. Uncertain as the sense to be attached to the title Caliph has ordinarily been, the idea has on the whole prevailed that he should have control of the sanctuaries and the access to them; there seems no means of devising a formula which should combine a Turkish Caliphate with an independent Hejaz. On the other hand, the removal of Turkish rule from Arabia, to which the events which followed the secession of the Hejaz led, has done little or nothing to realize the dream of Jalal Nuri of an empire embracing all the speakers of Arabic. The establishment of the Hejaz kingdom probably on the whole accentuated the sectarian differences which were already rife in the peninsula. A mission was indeed sent by the Emperor of Morocco to the Sherif of Mecca to congratulate him on his assertion of independence; but the legal authority who accompanied it gave it as his opinion that where Islamic countries were at a great distance from each other there was no objection to their being subject to different *Imams*; Morocco had at no time recognized the Eastern Caliphate, in whosesoever possession it happened to be; the independence of the Sherif therefore in no way affected the Moroccan Caliphate. Moreover, the history of Islam attested the frequent coexistence of numerous Caliphs (*Revue du Monde Musulman*, xxxiv., 1917-8, p. 140). The rise of this new power in the sanctuaries was not therefore to furnish a new principle of unity for Islam; it only helped to get rid of that round which the old Pan-Islamic ideas had been grouped.

In lieu of this there is some Pan-Arabian agitation; such at least is the purpose of a violent diatribe reprinted in the *Manar*

for August 1919 from an Arabic newspaper appearing in Brazil called *Suriyyah al-Jadidah* ("New Syria"), for the preceding May, wherein the author urges the Arabs to unite and emulate the exploits of the early heroes of Islam. Apparently he contemplates an Arab federation, to be governed by an assembly which is to meet at one of "the great Arabian cities," with home rule for the separate states. This orator names the Turks with the English and the French among the oppressors of the Arabs, whence his proposed confederation is evidently not intended to include any who are not Arabs by race or adoption; and indeed he traces the servitude of the Arabs to the practice of the Abbasid Caliphs, who relied on Persian and Turkish retainers in lieu of depending on Arab forces exclusively. In addition to this he traces their downfall to the personal ambition of the Arabs, each one of whom aspires to be chief. Probably this is in the main intended as anti-French propaganda; but it would seem that quite early in the war some persons had aimed at establishing a union between the various states in Arabia itself, to be extended into the neighbouring countries with a view to resist the enforced Turkification with which they were threatened. It failed to materialize because the Sherif of Mecca had reasons for refusing to join it, and the course of the war by no means tended to allay divisions between the states of Arabia; indeed, in July 1918 the King of the Hejaz issued a proclamation declaring the Wahabis infidels and urging his subjects to resist them with force. This conflict "wounded the heart of every Arab who desired the unity of his race and every Moslem who disliked discord between his co-religionists."

The attempts that have been made during these years in other Islamic countries to propagate the idea of a Moslem union seem to have been ordinarily similar to those which preceded the Ottoman Constitution. They consist largely in the encouragement of education, and the founding of societies and journals whose purpose is to keep the Moslems together, and to maintain some sort of relations with their co-religionists in other parts of the world. Certain countries, indeed, appear to have been outside the reach of such efforts; and there are some wherein if attempted they have been unsuccessful. The general result of the war would seem to be to show that the Pan-Islamic idea was doomed to disappointment from the first. The European Powers against whom it was directed—England, France, Russia and afterwards Italy—received during the course of it great proofs of loyalty and attachment from their Moslem subjects; and even if we do not take every protestation at its face value, it seems clear that there was little sense of unity with the Turks on the ground of common religion on the part of these populations, in which, on the contrary, the sense of patriotism to the empires within which they are incorporated had been developed. The proclamation of a *jihad* with no response shows that the time for the employment of that instrument has passed, if indeed it was ever effective; the insertion of the Ottoman Sultan's name in the *khutbah* of so many peoples, to whom he was unknown, no more made him their real ruler in this century than that of an Abbasid in the 10th or 15th century secured for the Caliph any real power. Possibly the call attracted attention to the nature of and qualifications for the Caliphate, a subject which the Ottomans were imprudent in bringing to the forefront.

This is not, indeed, the view of some Moslems in India, who have established an *All-India Caliphate Committee*, with a series of publications on the *Question of the Caliphate*. The first of this series contains the presidential address of "Maulana Abul-Kalam," purporting to have been delivered at the provincial Caliphate Conference held in Calcutta Feb. 28 and 29, 1920. This treatise presents the most bellicose aspect of Pan-Islamism, and differs little from the *Qaum Jadid* described above. The *jihad*, according to it, is the primary duty of the Moslem; if the Turks are apt to be lax in their ritual, it must be remembered that for centuries they alone maintained the *jihad*, at a time when the Indian Moslems were enjoying peace and security. An endeavour is made to show that ever since the time of Sultan Selim I. the Caliphate of the Ottoman Sultan has been generally recognized. It is argued that there can be only one Caliph, and that

it is the duty of every Moslem to be his obedient subject; and in particular to aid him in repelling invasions by unbelievers of Islamic territory and expelling them where they are already in possession; Islamic territory would appear to include the whole inhabited world. At the least the author claims that Arabia, Palestine and Iraq are the property of the Ottoman Sultan, which must be restored to him if the sentiments of the Moslems are not to be wounded. The Indian Caliphate Delegation sent to London went so far as to demand the cession of all the European lands which the Ottomans had ever occupied.

Ideas of this sort—not always carried to these lengths—are expressed by various authors and journalists in India, few of whose names are known in Europe. The best known of those who are claimed as advocates of them is probably the poet and philosopher Mohammed Iqbal, M.A., Ph.D. See this writer's *Secrets of the Self*, transl. R. A. Nicholson, London, 1920.

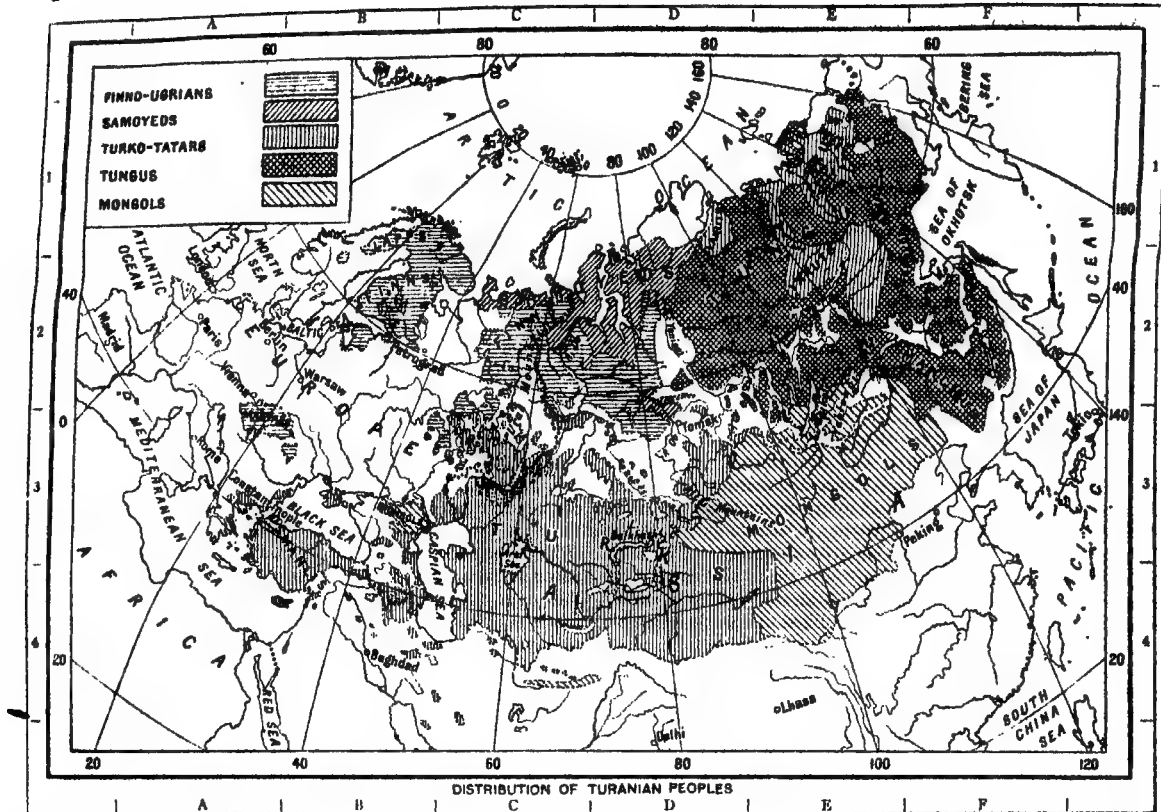

5. *After the War.* To what extent we can speak of Pan-Islamism since the Armistice is not clear. On the one hand it is evident that the occupation of Constantinople by foreign forces and the reduction of the Ottoman Empire to a comparatively small area have produced a feeling of depression among the Islamic peoples, who can no longer look with confidence to a great Islamic Power as the natural leader in some scheme for the recovery of hegemony in Asia and Africa; on the other hand, the feud between Sunnah and Shi'ah shows no signs of healing, and though an Arabian Caliphate may not yet have been formally proclaimed, the severance of the Arabs from the Turks appears to have been definitely concluded. Even within the Ottoman system there is at this moment a schism, since the authority in power at Angora acts independently of the Caliph of Constantinople, and appears to rely on Turanian support, so far as it obtains any from Islamic peoples; while its endeavour to obtain support from Bolshevism is calculated to wound the sentiment of orthodox Islam, which is far removed from the principles of that system. Further, it would appear that the tendency of recent events has been to emphasize nationalism, and create a desire in the various Arabic-speaking countries for complete independence rather than for absorption in an Islamic empire, even on the condition of decentralization, which was the catchword of the old Pan-Islamism. A Pan-Islamic tendency may perhaps be found in the Indian Caliphate agitation, but, even if it be taken at its face value, it is clear that it is making demands for the Ottoman Caliph which his former subjects do not back, and many who have made sacrifices for this idea have found no encouragement from Islamic rulers who at one time were supposed to recognize this title.

Conjectures are indeed at times put forward concerning the existence of agencies organizing simultaneous outbreaks in different Islamic countries against their European protectors; such may certainly exist, but the results hitherto achieved indicate little in the way of coöperation or clearness of aim; and indeed 'Abdul Hamid II., who gave some encouragement to the Pan-Islamic idea, which was that Turkey should lead a *jihad* against the European possessors of Islamic countries, does not appear himself to have entertained such a project, though he thought the fear of it might help him in checking European interference with his internal government. The governments which have followed have probably hoped for greater results, but have obtained very much less, being unable either to maintain the independence of Moslem states outside their empire or to preserve the integrity of that empire itself. It would seem then that Pan-Islamism, should it again acquire importance, must seek some other *point d'appui* than the Ottoman Empire; but only the futuro can tell whether such a *point d'appui* will be found.

PAN-TURANIANISM.—Only a few years before the outbreak of the World War in 1914, a new political movement of Turkish prominence in Constantinople. The awakening of the national consciousness began to aim at the pur-

PAN-TURANIANISM

Turkish language by the expulsion of all foreign elements, especially Persian and Arabic, and the establishment of a civilization based entirely on old Turkish traditions. In this movement Ziya Bey, Shinaasi Bey, and Namik Kemal Bey were particularly active. The researches of the Academy of Turkish Science, established after the Young Turk revolution, dealing with the original home and the pre-Mahommedan history of the Turks, were then artificially utilized greatly to widen the scope of the Turkish national movement. The goal was now the formation of a powerful and independent union of all the peoples of the world kindred to the Osmanli Turks and alleged to embrace a population of 50,000,000 (about double the actual number of those speaking Turkish dialects). For the national designation "Turk" was now to be substituted the more comprehensive "Turanian," and the Mahommedan crescent was to be abandoned for the pre-Mahommedan Turkish wolf as a racial emblem. Turkish writers began to speak of their ideal fatherland, their Turania, the cradle of their nation, and the home of their race. The poet Ziya Gök Alp, called by a countryman "the great Apostle of Turanianism," celebrates Attila, Jenghiz and Oghuz Khan as heroic figures that stand for the proud fame of his race, and describes the fatherland of the Turks not as Turkey or Turkestan, but as the "broad eternal land of Turania." This wider movement involves a policy of Irredentism which aspires not only to stimulate by moral and intellectual propaganda a feeling of racial unity among the kindred peoples, but under favourable circumstances to free those peoples from foreign rule. Curiously enough, the circumstances since the conclusion of the war seem to be more favourable to the realization of this ideal than they were before its outbreak. It is an ideal that is not likely to disappear, for its fulfilment is the only remaining prospect for Turkey of expansion as compensation for the great territorial losses that empire has sustained in recent times.

It now becomes necessary to inquire what possibilities this somewhat vague term Pan-Turanianism implies. The earliest form of the name "Turanian" occurs perhaps about 800 B.C. in

the *Avesta*, the sacred book of Zoroastrianism, as *Tura*, to designate a country which was contiguous to Iran (Persia) and the inhabitants of which were in constant conflict with the Iranians. It is met with again about A.D. 1000 in the *Shahname* or Book of Kings, of the Persian poet Firdusi as *Turān*, the country beyond the Oxus (now the Amu Darya). Persian sources show that the ancient Turan (Turania) corresponded roughly to the Russian Turkestan of to-day. In the second half of the 19th century "Turanian" came to be used as a loose designation of Asiatic languages that were neither Aryan nor Semitic, and to be similarly applied in a racial sense to the nomadic peoples speaking those languages, as opposed to the agricultural Aryans. The term has more recently become synonymous with "Altaic" or "Ural-Altaic." "Turanian" is here treated in this definite sense.

Having spread in prehistoric times from the Altai mountains in the centre of Asia, this ethnic family at the present day occupies a broad belt of territory extending from Thrace across Asia to the sea of Japan and reaching from about 35° N. lat. to the coast of the Arctic Ocean. It consists of five main branches, the Samoyeds, the Finno-Ugrians and the Tunguses constituting the northern, and the Mongols and the Turks the southern division. The countries inhabited by the Turanians are Siberia, Mongolia, Manchuria, Chinese and Russian Turkestan, Asia Minor, parts of Persia and Afghanistan, the Caucasus, the Crimea, the Volga and Pechora regions of eastern Russia, Lapland, Finland, Hungary, and portions of the Balkans.

Down to the outbreak of the World War all the Turanian peoples were subject to foreign (Russian, Chinese, Persian, Afghan) domination except the Magyars and the Osmanli Turks. Only those sections of the Turanians that have come into close contact with the Aryans of Europe have succeeded in rising from their primitive state to a comparatively advanced degree of civilization: the Finns, the Magyars and the Osmanli Turks.

The Turanians in Europe number in round figures 22,000,000: 10,000,000 Magyars; 6,000,000 Samoyeds and Finns; and 6,000,000 Turks. In Asia there are 26,000,000: 115,000 Finns, Samo-

yeds, and Tunguses, all in Siberia; 6,000,000 Manchus, Mongols and Turks, all until recently under Chinese rule; 8,200,000 Turks in Asiatic Russia; 3,500,000 in Persia and Afghanistan; and 8,000,000 Osmaali Turks in Asia Minor. The Turks in Russia are usually called Tatars, and those elsewhere outside the Turkish Empire, Turco-Tatars. Their language is the most characteristic feature of the Turanians. As contrasted with the highly inflexional Indo-European and Semitic linguistic families on the one hand, and the monosyllabic Chinese on the other, the Turanian languages are typical examples of the agglutinative form of speech. Here unchangeable roots are combined with suffixes by means of what is called progressive vowel harmony, in such a way that the vowels of the endings are assimilated to that of the root. Thus the infinitive element *mak*, which appears in Osmanli Turkish *yas-mak*, "to write," becomes *mek* in *sev-mek*, "to love."

The Mongolians best represent the Turanian physical type. They have broad faces, small, slanting eyes, high cheek-bones, broad, flat noses, thick lips and low foreheads: their complexion is yellowish brown, their hair straight, and their beards scanty. The various branches of the Turanians have intermingled to a considerable extent, but it was only on their western confines that they mixed much with aliens, especially Slavs. Thus many Finnish tribes have been absorbed by the surrounding Russians: the Magyars and the Osmanli Turks, though they have retained their Turanian speech, have lost most of their physical Turanian characteristics; while the Volga Bulgars have no trace of their original Turanian language and physique left, their name alone having survived among the Bulgarians of to-day.

The primitive religion of the Turanians is called Shamanism because its distinctive feature is the agency of the Shaman, a wizard priest, whose services are required to influence the supernatural powers. Witchcraft predominates in this religion, it being the function of the Shaman to master all that in nature is hostile to man, to curb the elements, to conjure spirits, to produce health or disease, fortune or misfortune. The Shamanist operates mainly against demons, but he also believes in higher gods, whom he calls to his aid by means of prayer and sacrifice. Ancestor worship is, moreover, a characteristic feature of Shamanism. An important instrument in the rites of the Shaman is the drum, by means of which he can summon spirits, and compel them to give active assistance. Shamanism is still found in all the Asiatic branches of the Turanian family. But it is only general among the Tunguses, all the tribes of whom (except the Manchus) are devoted to their old faith. The Samoyeds, too, are still largely Shamanists. Among the Mongols, the Buryats on Lake Baikal are the only tribe in which Shamanism prevails. Among the Turks, the old religion survives only in the tribes that remained behind in the Altai range. From the rest of the Turkish peoples it has been extirpated by Islam, though single tribes of Turkish nomads show clear traces of their original beliefs. On the other hand, the Magyars and the Finns adopted Christianity many centuries ago.

The very primitive stage of civilization which the Turanians had attained when they first appear in history, has remained on much the same level, with the few exceptions caused by European contact, down to the present day. As the cultivable soil of the ancient world had already been occupied by the Chinese, the Aryans and the Semites, the Turanians, when driven by the expansion of population to migrate from their ancient homes in the Altai mountains, were compelled to wander in barren steppes in order to maintain themselves. Their civilization thus acquired the stamp of nomadism, in which the isolation of small communities caused by their mode of life prevented the patriarchal system of government from advancing to any higher stage of political organization. The struggle for existence naturally brought them constantly into predatory conflict with their settled and more prosperous neighbours, while boundary disputes tended to perpetual internal strife. The unsettled habits thus produced have, since the adoption of Islam by the Turkish branch, made that branch for many centuries the main cause of unrest in the history of the world, because the directing force of fanaticism has been added to their unorganized restlessness.

The above account of the various branches of the Turanians will supply the material on the basis of which the prospects of Pan-Turanianism may be judged. The movement in its wider aspect having in the years preceding the war been the product of the German-educated *Intelligentsia* of Constantinople, was, after Turkey joined the Central Powers, much used in support of the alliance between Turkey and Hungary on the strength of racial kinship, and as a lure for the Tatars of the Russian Empire. In the summer of 1918, Halil Pasha, an uncle of Enver Pasha, had an interview, reported in a Berlin journal in 1920, with a German commanding officer in Anatolia, to whom he expounded the aims of the Pan-Turanian movement. Placing the national policy in the foreground, he said it was necessary to unite all Turkish-speaking peoples. The beginning must be made with the conquest of Turkestan, the cradle of the Turkish Empire. The next step would be to establish a connexion with the Siberian Yakuts, the farthest outpost of the Turkish Turanians in the north-east of Asia. After that, the Tatars of the Caucasus were to be included. This nationally exclusive Turkish Empire must, he continued, as a Mahommedan supreme power, have a great attraction for the Turks of Afghanistan and Persia. The incorporation of Azerbaidjan, the richest Persian province, might thus be hoped for in the near future. When, on the conclusion of the war, Constantinople had been occupied by the Entente Powers, Halil Pasha was thrown into prison there by them, but, managing to escape, he continued his activities in favour of a Pan-Turkish Empire. Enver Pasha had previously been emphasizing the Pan-Islamic policy and been using Arabs as Turcophil propagandists in the Caucasus. The general plan of this double procedure was by fusing the religious movement of Pan-Islamism with the racial movement of Pan-Turanianism to establish a great Turkish Empire, with Constantinople as the centre of both.

Pan-Turanianism, from the point of view of practical politicians, does not go beyond the ideal of a Turkish Empire comprising all the divisions of the Turkish race, the numbers of which do not really exceed about 26,000,000. As the Ottoman Empire contains no more than 10,000,000 Turks within its present limits, the Irredentism of the Pan-Turanian movement embraces a population of 16,000,000. Before the war, 12,000,000 of these were under Russian and 4,000,000 under Chinese, Persian and Afghan rule. At that period Russia could scarcely be regarded as a very promising field for Pan-Turanian propaganda; for generally speaking the Russian Mahommedans had been loyal, conservative, and somewhat narrow in their political outlook. Had Russia emerged intact from the conflict, her Turkish territory could have been wrested from her only at the price of another war, which the Ottoman Empire would hardly have been willing to face. But the whole situation has been transformed by the Russian Revolution and the consequent break-up of Russia. The Irredentist ambitions of Pan-Turanianism have now been brought appreciably nearer the possibility of realization. A warmer sympathy has been developed among the Russian Mahommedans with the Mahommedans abroad. Russian Turkestan and the two Khanates of Khiva and Bukhara have asserted their independence; the Tatars of the Caucasus have become republics. These new conditions might render the voluntary incorporation of all these outside Turkish populations in the Ottoman Empire not unlikely. For the important unifying elements of general identity of language, religion, and civilization, besides contiguity of territory, are all present. The speech of the Turkish branch of the Turanians has changed so comparatively little that all the divisions may be said to speak one single language, Turkish, differing only to the extent of dialects. Islam is the religion of all the divisions of the Turkish branch, which, though it only adopted the religion, has been its main protagonist. The Turkish-speaking peoples, again, have a common civilization which, based on primitive nomadism, has as its superstructure the ethics and culture of the Koran. Finally, with the exception of the Tatars in the north-east of Siberia, the Turkish peoples are in continuous geographical contact from Thrace eastwards to the frontier of Mongolia and northward into south

The connexion of eastern Asia Minor, by way

with Central Asia, which was closed by Tsarist Russia, is now open for the union of the Turks. This road to the East is of great importance both on political and economic grounds.

If the spirit of independence among the Turks of Central Asia, the Caucasus, and Azerbaidjān could be overcome by the unifying power of common language, race, religion, and culture, Turkey might become a formidable political power based on the combined moral force of the Caliphate and of Turkish nationalism.

Pan-Turanianism, however, if pushed to extremes, is an artificial and a retrograde movement, and would then come into irreconcilable conflict with Pan-Islamism. Thus the attempt to carry out the proposal of some of the Turks of Constantinople to renounce the religion of Mahomet, or even to substitute Turkish for the sacred language of the Koran, would incense the fanatical Moslem. Again, the Turkish peoples outside the Ottoman Empire do not form coherent populations, containing as they do large nomadic elements. On the other hand, the Ottoman Turks, indolent by nature, have never displayed any ability or energy in state-building. It is therefore not likely that they will develop enough statecraft and driving-power to succeed in welding together the different Turkish peoples into a single strong united empire containing perhaps 25,000,000 of the Turkish race. The extension of Pan-Turanianism so as to include other branches of the Turanians can only be pronounced to be a purely visionary idea. The only connecting link between them and the Turks at the present day is the descent of their various languages from a single parent speech that existed in remote antiquity: but Lapp and Manchu are to-day farther apart than English and Sanskrit. The other four branches now differ from the Turks in religion and civilization, besides being separated from them by great and often immense distances. The Samoyeds are nominally Christians, but really Shamanists. The Tunguses, who inhabit a vast tract of north-eastern Asia as Shamanists and reindeer nomads, are slowly dying-out in Siberia while their most prominent tribe, the Manchus, are being entirely absorbed by Chinese civilization. The Mongols, who are the eastern neighbours of Turkish tribes, and were many centuries ago politically associated with the Turks as warlike invaders of the West, are nomads and for the most part adherents of Buddhism, which has transformed them into a peaceful and unenterprising people that at the present day has hardly anything in common with the Turks. The Finno-Ugrian branch, for the most part separated by long distances from the Turks, have with very slight exceptions been thoroughly Europeanized and Christianized for many centuries. The Magyars, conquered by the Turks in the 16th and 17th centuries, fought on the side of the Turks during the World War owing to the pressure of the German alliance; but there seems to be no permanent prospect of political association between these two racially and linguistically related races. It thus seems clear that at least 20,000,000 Turanians will never have the slightest inherent tendency to be drawn into union with the Islamic religion and civilization of the Turkish Empire.

PARAGUAY (see 20.756).—The pop. of Paraguay in 1920 was supposed to be about 800,000. At least 60% of the inhabitants were illiterate, though President Franco during 1916-9 made an attempt toward educational progress. The school registration for 1916 was 80,142.

Of the imports of Paraguay 81%, and of the exports 40%, pass through the Asunción custom-house. The total foreign trade of Paraguay varied little between 1907 and 1918 though the proportion of imports to exports differed, as will be seen from the following table, showing the official customs values in Paraguayan gold pesos, equal to 4s. or 80.96 each:—

	Imports	Exports	Total
1907	7,512,502	3,236,110	10,748,612
1917	5,098,581	6,494,802	11,593,383
1918	5,201,726	7,171,319	12,373,045

The United Kingdom had first place in imports until 1908, when Germany passed her, supplying 29% of the total imports as against Great Britain's 21 per cent. A close competition followed. In 1913 the United Kingdom supplied 28.6% of Paraguay's imports as compared with 27.6% from Germany, but in 1914 the situation was reversed, Germany supplying 27% to the United Kingdom's 22.7 per cent. In 1915 and 1916 the proportion of imports from the United Kingdom rose to 33% and 38.5% respectively. There was in 1921 only one strictly British mercantile house, and only one American, as compared with five German houses.

History.—Manuel Gondra became President on Jan. 18 1911 but was overthrown by a revolution headed by Col. Albino Jara in July of that year. Jara was succeeded in turn by Liberato Rojas, who was overthrown Jan. 14 1912 by another "alteration of the legal order" as a consequence of which Pedro Pena was placed in the presidential chair Feb. 29. Considerable bloodshed accompanied these changes, which cost the country at least £400,000. On March 25 Emiliano Gonzalez Navero became President, retaining office until Aug. 15, when Eduardo Scherer succeeded him. Scherer actually completed his term of office, the first time this had occurred in Paraguay since 1870. His firmness prevented several outbreaks and disturbances, especially one at the beginning of 1915, which might have been most serious under a weaker executive. Scherer's successor was fortunately another able man, Manuel Franco, who retained his position from Aug. 15 1916 until his death on June 3 1919. Franco not merely forestalled revolutions, but brought Paraguayan finance to the best condition it had reached for years. During his administration the meat-packing industry became fully established in Paraguay. This was the greatest step forward that had occurred since 1870. By encouraging an industry which more than almost any other improves the lot of the individual farmer in a rather isolated agricultural country, the three United States packing-houses that established themselves in Paraguay during President Franco's administration were of great service. They caused a thorough survey of Paraguay's cattle-raising possibilities to be made and also studied the different grasses and areas of pasturage and their suitability for different breeds of cattle. In 1918 37% of the total exports of Paraguay consisted of the products of stock-raising and meat-packing as against 32.4% for the products of the forest industries (lumber, quebracho, etc.) and 30.2% for agricultural products.

José P. Montero filled the remainder of Franco's presidential term, from June 3 1919 to Aug. 15 1920, when Manuel Gondra again became President, having been elected while minister to the United States. The lessened demand from Europe and the United States for the chief exports of Paraguay at the close of the World War caused a decided setback to Paraguay's prosperity. On Jan. 1 1921 Paraguay was unable to meet the payments due on her foreign debts, and the largest banks in the country became seriously involved, further aggravating the commercial crisis. An American financial adviser was assisting the Paraguayan Government in 1921. On Nov. 17 1913 through rail communication was inaugurated between Asunción and Buenos Aires. This has done much to lessen the isolation of the country, for under normal conditions the journey between the two cities is made in 50 hours. Paraguay renewed direct diplomatic relations with the United States in 1913, sending a minister to Washington for the first time in eight years, while the United States created a separate mission for Paraguay in the same year, accrediting a minister to Paraguay alone, instead of to Uruguay and Paraguay jointly as formerly. Great Britain in 1921 still accredited one minister to both countries. The United States and Paraguay signed an extradition treaty on July 30 1913. In Nov. 1921, Pres. Gondra was ejected from office as the result of a revolution.

The Government remained neutral during the World War, though Congress adopted a resolution of sympathy with the Allies and of approval of the action of the United States in declaring war on Germany. The Government dismissed some of its German employees, and maintained a pro-Ally attitude.

The best recent book on Paraguay is: W. L. Schurz, *Paraguay, a Commercial Handbook*, published by the Government Printing Office at Washington, D.C., 1920. (C. L. C.)

PARAVANE, a naval device used in the World War first for attacking submerged submarines and subsequently for protecting vessels against mines and for cutting up hostile minefields. The name of Acting-Comm. C. D. Burney is especially associated with its design and development.

The explosive paravane in its final form consisted of a torpedo-shaped body carrying near its head a large steel plane which was set at a small angle to the centre-line of the body, and was in an approximately vertical position when the paravane was being towed. The thrust of the water on the plane carried the paravane away from the towing vessel, and with two paravanes, one on each side, a spread or sweep of about 200 ft. was obtained, i.e. the two paravanes were that distance apart. Horizontal and vertical fins near the tail increased the stability, and in the tail was fitted a depth-keeping mechanism consisting of a horizontal rudder actuated by a hydrostatic valve which responded to any difference in the water-pressure caused by a change of depth. The paravane carried a heavy charge of high explosive which could be detonated, by means of an electric current passing through the core of the towing-wire, in any one of three ways. If the paravane hit the hull of a submarine, striking-gear on its nose operated a switch which closed the firing circuit. This impact method would not become operative should the towing-line become entangled in the external fittings of a submarine, but in that case an extra load would be put on the line; apparatus was therefore provided such that when the load on the line exceeded a predetermined value a switch was tripped and the circuit closed. Finally a hand-switch on the bridge of the towing vessel enabled the charge to be detonated at will should the presence of a submarine be suspected.

It was soon seen that the explosive paravane could be adapted to protect vessels against moored mines. For this purpose the towing-lines were attached, not at the stern as with the explosive paravanes, but at a point as far forward and as low down as possible. Their outboard ends being kept about 100 ft. away from the central fore and aft line of the ship by the paravanes to which they were attached, they swept a wedge-shaped track in a horizontal plane at the level of the keel or slightly below it, and cut out the mooring-wires of any anchored mines lying in or near the course of the vessel. When this happened the mooring-wire was reflected along the towing-line until it reached the head of the paravane, where it was guided into the jaws of shears or scissors made of special high-grade steel, by which it was severed. The mine then floated to the surface and was exploded by rifle-fire. It was found that with a pull of about 7 cwt. the shears would cut a $1\frac{1}{2}$ in. mooring-wire. The normal length of the towing-lines was 56 yd.; three-strand wire ropes were used, each consisting of 17 galvanized wires, 0.049 in. in diameter, with an ultimate breaking strength of between 100 and 120 tons per sq. in. There were three types of protector paravanes: (1) The merchant-vessel type, known as "otters," for ships with speeds below 16 knots; (2) the fast-liner type; and (3) the battleship type.

The mine-sweeping paravanes were towed from the stern of high-speed destroyers. As the point of attachment had to be on deck, an arrangement called a "depressor" was used to bring the virtual point of tow down to the required depth at the stern. Wide paths could be swept at speeds of 26 to 30 knots.

PARDO BAZAN, EMILIA (1851-1921), Spanish author (see 10.800), died in May 1921.

PARIS (see 20.804).—The population of the French capital, 2,847,229 at the census of 1911,—was 2,006,472 at the census of 1921. In view of the rapid German advance on Paris after the outbreak of war in August 1914, steps were quietly taken to vacate as many as possible of the civilian population; and on the night of Sept. 2 the President and ministers left the city for Bordeaux, where the Government was temporarily transferred. But the victory of the Marne removed the peril from Paris, and in December the Government returned there.

Paris during the World War was bombarded by aeroplane, Zeppelin, and artillery; 746 bombs were dropped from the air, killing 266 persons and wounding 603; German long-range artillery fired 303 shells into Paris, killing 256 persons and wound-

ing 620. The first air raid was made on Aug. 30 1914, by aeroplane and in daylight. The first Zeppelin raid took place by night on March 21 1915. The worst air raid was made on the night of Jan. 30-31 1918, when 91 bombs fell upon the city itself and 178 on the suburbs. The long-range bombardment began on March 23 1918, and continued until Aug. 9, with many intervals of calm, there being only 44 days upon which the Berthas were active. The existence of such long-range artillery being unknown when the first shells fell at an early hour of the morning, it was imagined that German aircraft, hidden high behind the clouds, must be engaged. All work in the city was at a standstill until noon, when the regularity with which the projectiles exploded at intervals of about 20 minutes, and an examination of some of their fragments, showed that a new engine of war was at work. The first two days of bombardment were the heaviest from the point of view of the number of shells fired, but from the number of casualties caused, March 29, when only one shell fell in Paris, was the most costly. That one shell fell during Good Friday service on the church of St. Gervais, bringing down with it a large portion of the roof; 88 people were killed and 68 wounded.

The air defences of Paris were not properly organized until March 1918. In fact organization had not been necessary, as German air services concentrated all their bombing raids upon England during the years 1916-8. The results obtained by the Paris system of air defences were as follows: on 13 different occasions, on which 107 aeroplanes all-told were employed, no single raider was able to reach Paris; of the 483 planes sent by the enemy to Paris in 1918, only 37 reached the city, and 13 were brought down; and only 11,680 kgm. of bombs were thrown upon the city.

The war being over, the work of demolishing the fortifications encircling the city was begun in 1919, in accordance with a grandiose scheme which would give Paris another ring of boulevards nearly 30 m. in length. It was intended that some of the ground thus made available should be used for building purposes, in the hope of solving the acute housing problem. It was proposed to keep much of it as garden, and to build numbers of well-equipped playing-grounds, and air stations round the city. One portion of the available space, S. of the city, was to be set apart for "University City," where accommodation would be provided for students of all nationalities; to include recreation and sports grounds, swimming-baths, etc. The site chosen is near the Parc Montsouris.

PARKER, ALTON BROOKS (1852-), American lawyer, was born at Cortland, N.Y., May 14 1852. He studied at the local academy and normal school, taught for a short time, read law in an office, and in 1873 graduated from the Albany Law School. He was admitted to the bar and began to practise law at Kingston, N.Y. In 1877 he was elected surrogate of Ulster co., and was re-elected in 1883. He resigned in 1885 on being appointed by the governor justice of the N.Y. Supreme Court to fill a vacancy, and the following year was regularly elected. He was a delegate to the Democratic National Convention in 1884 and in 1885 declined President Cleveland's offer of the first assistant postmaster-generalship. He was appointed a member of the second division of the N.Y. Court of Appeals in 1889 and a member of the general term in 1893. In 1898 he was elected chief justice of the N.Y. Court of Appeals. In 1904 he resigned on being nominated by the Democrats for president, but he was defeated by Theodore Roosevelt, the electoral vote being 336 for Roosevelt to 140 for Parker, the popular vote 7,623,486 for Roosevelt to 5,077,971 for Parker. He then resumed the practice of law in New York City. He was a delegate-at-large from New York to the National Democratic Convention in 1912. In 1913 he was counsel for the managers of the trial leading to the impeachment of Governor Sulzer of New York.

PARKER, SIR GILBERT, BART. (1862-), English novelist and politician (see 20.827), was created a baronet in 1915 and a privy councillor in 1916. During the first two and a half years of the World War he was engaged on the work of publicity in

British interests in the United States, and he published *The World in the Crucible* (1915) and *The World for Sale* (1916). Amongst his later works of fiction are *The Judgment House* (1913); *The Money Master* (1915); *Wild Youth and Another* (1919) and *No Defence* (1920). He retired from Parliament in 1918 and did not seek re-election.

PARKER, HORATIO WILLIAM (1863–1919), American composer and musician, was born at Auburndale, Mass., Sept. 15 1863. His talent for composition manifested itself early; before he was 15, for example, in less than two days he set to music the verses in Kate Greenaway's *Under the Window*. He studied first in Boston, but later attended for three years the Royal Conservatory in Munich. After his return to America in 1885 he was for two years professor of music in the Cathedral School of St. Paul in Garden City, Long Island. From 1888 to 1893 he was organist of Trinity church, New York City, and from 1893 to 1901 organist of Trinity church, Boston. In 1894 he was appointed professor of the theory of music at Yale. Cambridge University bestowed on him the degree of Mus. Doc. in 1902. Before leaving New York City he had completed his oratorio, *Hora Novissima*, which was widely performed in America. It was also given in England in 1899 at Chester and at the "Three Choirs" festival at Worcester, the latter an honour never before paid an American composer. While carrying out the duties of his position at Yale he composed much. His opera *Mona* (libretto by Brian Hooker) won the Metropolitan Opera Company's \$10,000 prize in 1911, and in 1914 his opera *Fairyland* (also with Hooker) was awarded another prize of the same amount offered by the National Federation of Women's Clubs. His cantata *Morven and the Grail* was written in 1915 for the centenary celebration of the Handel and Haydn Society of Boston. His other works include the cantatas *King Trojan* and *The Kobolds*, the oratorios *St. Christopher* and *A Wanderer's Psalm*, besides numerous sacred and secular pieces. He died at Cedarhurst, Long Island, Dec. 18 1919.

PARKER OF WADDINGTON, ROBERT JOHN PARKER, BARON (1857–1918), English lawyer and lord of appeal, was born at Claxby Rectory, Alford, Lincs., Feb. 25 1857. He was educated at Eton and King's College, Cambridge, where he took his degree in 1880. In 1883 he was called to the bar and built up a large and important connexion, largely dealing with Government work. In 1900 he was appointed junior counsel to the Treasury, and was raised to the bench in 1906. As a judge he earned a high reputation for great shrewdness and learning, and in 1913 was made a lord of appeal in ordinary, being at the same time given a life peerage over the heads of the five sitting lords justices. In 1916 a special second division of the Judicial Committee of the Privy Council was constituted for dealing with Prize Court appeals, and over this Lord Parker presided until within a short time of his death at Haslemere July 12 1918.

PARKIN, SIR GEORGE ROBERT (1846–), British educationalist (see 20.831), published in 1912 *The Rhodes Scholarships*, an account of his work as organizing representative of the Rhodes Trust (see 23.257). He was knighted in 1920. He retired from the secretaryship of the Rhodes Trust in 1921, being succeeded first by Sir Edward Grigg, and then, on the appointment of the latter to be private secretary to Mr. Lloyd George, by Mr. Geoffrey Dawson, formerly (1912–9) editor of *The Times*.

PARMOOR, CHARLES ALFRED CRIPPS, 1ST BARON (1852–), English lawyer, was born at West Ilsley, Berks., Oct. 3 1852, the son of Henry William Cripps, Q.C. He was educated at Winchester and New College, Oxford, where he had a distinguished career. He was called to the bar of the Middle Temple in 1877, in 1890 became a Q.C. and in 1893 a bencher. In 1895 he was appointed attorney-general to the Prince of Wales (being reappointed in 1901 and 1912). He sat as Conservative member for the Stroud division of Glos. 1895–1900, for the Stretford division of Lancs. 1901–6 and for the Wycombe division of Bucks. 1910–4. In 1908 he was made K.C.V.O. Sir Alfred Cripps was well known as a strong High-churchman. He was appointed chancellor and vicar-general to the province

of York in 1900 and vicar-general to the province of Canterbury in 1902. He was chairman of the Canterbury House of Laity and a member of its committee in 1910, and chairman of the House of Laity in the National Church Assembly of 1920. In 1914 he was appointed a member of the Judicial Committee of the Privy Council and raised to the peerage, and in 1917 he became treasurer of the Middle Temple. He was the author of two important works, *Law of Compensation* (1881, 5th ed., 1905), and *Law Relating to the Church* (6th ed., 1886).

PARRATT, SIR WALTER (1841–), English organist, was born at Huddersfield Feb. 10 1841. He was educated privately and at College School, Huddersfield. After some years as organist and choirmaster to various churches, he became in 1872 organist of Magdalen College, Oxford, and in 1882 organist of St. George's Chapel, Windsor. From 1908 to 1918 he was professor of music at Oxford, and in 1916 was appointed dean of the faculty of music in London University. He was knighted in 1892, was created M.V.O. in 1901, and C.V.O. in 1917. He wrote various important articles on musical subjects for Grove's *Dictionary of Music*, and other works.

PARRY, SIR CHARLES HUBERT HASTINGS, BART. (1848–1918), English composer (see 20.865), retired from his professorship at Oxford in 1908. He acted during the World War as chairman of the Music in Wartime Committee, and did much to relieve the prevailing distress among poorer musicians. He died at Rustington Oct. 7 1918, and was buried in St. Paul's cathedral.

PARSONS, ALFRED (1847–1920), English painter, was born at Beckington, Som., Dec. 2 1847. He was educated privately, and in 1865 entered the General Post-Office as a clerk, but after two years his taste for painting decided him to adopt an artistic career. He was preëminently a painter of flowers and gardens. He was also interested in the designing of gardens, and was a judge at the Chelsea flower show. His picture of an orchard, "When Nature Painted All Things Gay," was purchased by the Chantrey fund in 1887, and he was a frequent exhibitor not only at the Royal Academy but at the Grosvenor and New Gallery exhibitions. Among the various special exhibitions held of his work was one of scenes from the Warwickshire Avon (1885). As an illustrator Parsons took a very high place, much of his work appearing in *Harper's Magazine*, while among the books he illustrated are *She Swoops to Conquer*, Herrick's *Poems* (with E. A. Abbey), and *The Danube, from the Black Forest to the Black Sea* (with F. D. Millet). He died at Broadway, Worcs., Jan. 16 1920.

PARSONS, SIR CHARLES ALGERNON (1854–), British engineer, was born in London June 13 1854, the fourth son of the 3rd Earl of Rosse. He was educated privately and at St. John's College, Cambridge, graduating 11th wrangler in 1876, and being elected in later life (1904) an hon. fellow of the college. In 1877 he entered the Armstrong Works at Elswick, having previously worked as a boy in his father's workshops at Birr Castle, King's co., Ireland, where the Rosse telescope was constructed (see 23.745). In 1883 he served for a year on the experimental staff of Messrs. Kitson of Leeds, and in 1884 entered into partnership with Messrs. Clarke Chapman & Co. of Gateshead. The partnership was dissolved in 1889, and Charles Parsons, whose invention of the Parsons steam-turbine was bringing him into continually greater prominence in connexion with the progress of shipbuilding, then built his own works at Heaton, Newcastle-upon-Tyne, for the making of steam-turbines, dynamos, searchlight reflectors and other electrical apparatus (see 25.845 seq.). Besides his chairmanship of C. A. Parsons & Co., he became managing director of several electric supply companies, notably at Newcastle, Scarborough and Cambridge, and also of the Marine Steam Turbine Co. which became the Parsons Marine Steam Turbine Co. of Wallsend-on-Tyne, owners of the turbine patents, with ramifications throughout the engineering world. He was elected F.R.S. in 1898, won the Royal Society's Rumford Medal in 1902, was president of the Institute of Marine Engineers 1905–6 and of the British Association 1919–20. In 1911 he was created K.C.B. During the World War Sir Charles

sons served on many Government committees connected with scientific research, electric power, aircraft, fuel research and the construction of tanks.

PASCAL, JEAN LOUIS (1837-1920), French architect, was born in Paris June 4 1837, and his architectural education was begun at the age of 16 when he became a pupil of Gilbert. Later, when in the studio of Questel, he entered the École des Beaux-Arts, where, amongst other distinctions gained, in 1866 he won the *Grand Prix de Rome*. On his return to Paris in 1870, after his four years at the Villa Medici, he was appointed inspector of works at the Louvre and the Tuilleries. In 1872 he became patron of his *atelier*, and thereafter was appointed successor in public competitions, and subsequently received many distinctions. Amongst these was his election to the council of the Beaux-Arts and president of the jury, and to membership of the Institut de France, and finally he became *commandeur de la Légion d'Honneur*. In his long career the private, as apart from official, work of Pascal was of a very diversified nature, and covered a wide area of ground, domestic and civil, and particularly a long series of artistic memorial monuments such as those commemorating Col. d'Argy at Rome, Henri Regnault at the École des Beaux-Arts, and President Carnot at Bordeaux. Among his buildings are the Château du Doux, Corrèze, that for the Faculté de Médecine, Bordeaux—a design with much lightness and calm—the painter Perrault's house and studio, Paris, and several villas and châteaux in the provinces—at Pau, Beaulieu, Avignon and elsewhere. He lived long enough to see, at the close of his busy career of over 50 years, the completion of the Bibliothèque Nationale, Paris, a fine building characteristic of his learning and ingenuity, but speaking none of the modern note of a too conscious individuality. A man of untiring energy, Pascal's application to his *atelier* work and his many professional calls did not prevent his finding time for the literary side of architecture and he, with M. Gaudet, is responsible for the splendid edition of Blondel's *Architecture Française*, published under the auspices of the French Government. The celebrated *atelier* of which he was for so many years the greatly respected patron, was responsible in his time for the training of many architects to be found later on in every country in Europe, in the United States and in Canada. Among them were Sir John Burnet, Thomas Hastings of New York, Signor Beltrami of Milan and Henri Nénot of Paris. In 1914 he was awarded the gold medal of the Royal Institute of British Architects but his great age and state of health prevented his receiving this in person. He died in Paris in 1920.

PASCOLI, GIOVANNI (1855-1912), Italian poet, was born at San Mauro, Romagna, Dec. 31 1855. His first volume of verse, entitled *Myricae*, appeared in 1891, and his *Primi Poemetti* in 1897. His other volumes include *Odi ed inni* (1906); *Le Canzoni di Re Enzo* (1908) and *Nuovi Poemetti* (1909). He wrote also much elegant Latin verse, and was well known both as a prose essayist and for his Dante studies, which led to his appointment as professor of Italian literature at the university of Bologna. He died at Barga April 6 1912.

PASSY, FRÉDÉRIC (1822-1912), French economist and pacifist, was born in 1822 and was a nephew of the economist Hippolyte Passy, finance minister to Louis Philippe and to Louis Napoleon's Republican Government. Under his uncle's influence Frédéric devoted himself to economic studies, and to that end gave up the appointment as auditor of the Conseil de Droit, which he had held during 1846-49. In 1860 he began to teach political economy both in Paris and in the provinces. His first work on the subject, *Mélanges économiques*, appeared in 1857. True to his republican principles, he refused to be reconciled to the Second Empire, and remained, therefore, ineligible for any Government post. He was an ardent free-trader and an admirer of Cobden. In 1867 he founded the Ligue Internationale de la Paix, afterwards known as the Société Française pour l'Arbitrage entre Nations, and for the rest of his life he devoted himself to the promotion of international peace. From 1881 to 1899 he was deputy for the Seine department. In 1901 he received the Nobel Prize, sharing it with M. Dunant. His published works include

De la Propriété Intellectuelle (1859); *Leçons d'économie politique* (1860-61); *La Démocratie et l'Instruction* (1864); *L'Histoire du Travail* (1873); *Malthus et sa Doctrine* (1868); *La Solidarité du Travail et du Capital* (1875) and *Le Petit Poucet du 19^{ième} Siècle* (George Stephenson (1881). He died in Paris June 12 1912.

PATIALA, SIR BHUPINDAR SINGH, MAHARAJA OF (1891-), head of the Sikh community in India, was born Oct. 12 1891, to the soldier-sportsman Maharaja Sir Rajendra Singh, whose death in Nov. 1900, at the age of 28, brought him to the *gadi*. He was carefully trained, and on receiving full ruling powers at the close of 1910 maintained and greatly developed the progressive policy of the council of regency, applying himself with great assiduity to the moral and material welfare of his people. Inheriting sporting and soldierly qualities, he was a skilful polo-player and batsman, becoming well known to British crowds when he captained the Indian cricket eleven in 1911. He also inherited the conspicuous loyalty of his house to the paramount Power. In the autumn of 1914 he set out with the Indian Expeditionary Force to France, but serious ill-health compelled his return to India after reaching Aden. The contribution of Patiala to the Indian army, including Imperial Service troops, was increased from about 4,000 men to 28,000, and as the recognized head of the Sikh race the Maharaja exercised an enormous influence in promoting recruitment from other parts of the Punjab. His subjects saw active service in nearly all the theatres of war, and won 125 battle distinctions. His gifts in material and money were constant and generous. He visited his troops in France, Palestine and elsewhere when deputed to England in the summer of 1918 with Sir S. P. (Lord) Sinha on selection as a member of the Imperial War Cabinet, being the second Indian prince to be called to Empire councils. In the Punjab disturbances in the spring of 1919 important responsibilities were assigned to him by the British authorities, and tranquillity was maintained throughout his state and adjacent British districts. In the third Afghan War which immediately followed he volunteered his personal services as well as the loan of his troops, and held a staff appointment in a trying hot-weather campaign, not returning from the frontier until an armistice was granted the Amir Amanulla. He took a prominent part in promoting the inauguration of the Chamber of Princes in 1921 and was elected to the small standing committee. He was raised to the rank of major-general, his permanent local salute was raised from 17 to 19 guns, and he held the grand crosses of the Star of India, the Indian Empire and the British Empire.

PATON, FREDERICK NOEL (1861-1914), British explorer and Anglo-Indian official (see 20.030*), died July 1 1914.

PATON, JOHN BROWN (1830-1911), British Nonconformist divine (see 20.030), died at Nottingham Jan. 26 1911.

PATTI, ADELINA JUAÑA MARIA [BARONESS CEDERSTRÖM] (1843-1919), English singer (see 20.937), died at Craig-y-Nos Castle, Wales, Sept. 27 1919.

PAYNE, JOHN BARTON (1855-), American public official, was born at Pruntytown, Va., Jan. 26 1855. He was educated at Orleans, Va., read law, and was admitted to the bar in 1876. He moved to West Virginia and practised law at Kingwood from 1877 to 1882, during the same period serving as chairman of the county Democratic committee. In 1882 he was elected mayor of Kingwood, and the following year went to Chicago, where he was engaged in law practice until 1893. Then he was appointed judge of the Superior Court of Cook Co., Ill., but resigned after five years to resume the practice of law. In Nov. 1917 he was appointed counsel of the Emergency Fleet Corporation and also legal adviser to the Commissioner of Internal Revenue. In 1918 he was appointed counsel of the Director-General of Railroads and in 1919 chairman of the U. S. Shipping Board. In Feb. 1920 he was appointed Secretary of the Interior, to succeed Franklin K. Lane, and he served to the end of President Wilson's term.

PEACE CONFERENCE (1919).—The first plenary session of the Conference of the Powers assembled in Paris to settle the terms of peace after the World War was held on Jan. 1919, more than two months after the conclusion of the armistice with Germany; and the Conference remained in

* These figures indicate the volume and page number of the previous article.

that date until Jan. 21 1920, when the Supreme Council met for the last time. Even then the work of the peace settlement was incomplete. What remained to be done was partly delegated to a council of ambassadors at Paris, partly left to the Premiers of the principal Powers, who continued to meet in consultation at irregular intervals during 1920 and 1921. The Conference separated before the Hungarians had decided to sign their treaty, and before the terms of the partition of the Ottoman Empire were finally agreed upon. It left the Adriatic question in such a state that 10 months elapsed before Italy and Yugoslavia could compose their differences. The total sum to be demanded from Germany in the name of reparation had not yet been settled, nor had the principal Powers finally agreed in what proportions this sum should be divided between them. But the events of 1920 showed that most, if not all, of these questions could be arranged without the cumbrous mechanism of a conference. An even more momentous uncertainty, the problem of the future attitude of the United States towards the treaties, would obviously be solved at Washington and not at Paris. But the most urgent difficulties of the transition from war to peace had been met, so far as diplomacy could meet them, before the Conference was six months old; and, after the German treaty had been signed, the doings of the statesmen at Paris no longer excited the same interest as before. The most important of these statesmen, except the French Premier, M. Georges Clemenceau, soon made their exit. In the last days of June 1919 Mr. Wilson returned to the United States, Mr. Lloyd George to London. Sig. Orlando had fallen from power before the signing of the treaty, and his successor, Signor Nitti, abstained from visiting Paris. In July Mr. Lansing, the American Secretary of State, withdrew, leaving Mr. Polk, his under-secretary, to act for him. In Sept., after the signing of the Austrian treaty, Mr. Balfour departed and Sir Eyre Crowe became the chief British plenipotentiary. By June 28 the main outlines of the new map of Europe were drawn; the principles which were to govern all the treaties had been laid down; Germany had been rendered powerless for evil, and the Austro-Hungarian Monarchy had ceased to exist.

The Secret Treaties and the Pre-Armistice Terms.—The Allied and Associated Powers entered the Conference with a load of previous commitments.¹ The three chief European Allies had to consider many secret undertakings given at critical periods of the war. In April 1915 France and Great Britain had purchased Italy's cooperation by the Treaty of London, which gave very definite pledges regarding Istria, Dalmatia, Cisalpine Tyrol, the Dodecanese and Adalia. In May 1916 France and Great Britain had mapped out their future spheres of influence in the Ottoman Empire; and in 1917 there had been consequential arrangements with Italy. In Aug. 1916 all three Powers had given pledges to Rumania regarding her claims on Hungarian territory, pledges which Rumania at least did not regard as invalidated by her subsequent Treaty (of Bucharest, May 1918) with the Central Powers. In Feb. 1917 all three had agreed with Japan to uphold her claims on Shantung. Finally there were agreements of a less definite character with Serbia and with Greece. It remained to be seen how far these compacts could be reconciled with each other and with the views of the United States, who had not endorsed any of them and was officially unaware of them up to the opening of the Conference. There remained the pre-Armistice terms which were binding on all the parties to the Conference, and which indisputably must prevail wherever they came into conflict with treaties of prior date. Drafted at Washington, on the basis of a separate correspondence between Mr. Wilson and the German Government, they had nevertheless been considered and adopted (with certain amendments) by the Supreme War Council of the Allies as the foundation of the future peace. This meant that (with the exceptions which they or Mr. Wilson had specified in Oct. and Nov. 1918) the Allies were bound to impose no terms which clashed with

¹For the preliminaries leading to the Armistice of Nov. 11 1918, see under WORLD WAR. See also, for points unsettled at the Peace Conference, SILESIA and other appropriate headings.

Mr. Wilson's Fourteen Points (of Jan. 8 1918), his Four Principles (of Feb. 11), his Four Ends (of July 4) and his Five Particulars (of Sept. 27).

This peculiar obligation was the outcome of an offer, made by Germany on Oct. 4 1918, "to accept the programme set forth by the President of the United States in his message to Congress of Jan. 8 1918, and his later pronouncements, especially his speech of Sept. 27," as a basis for peace negotiations. A similar offer was made by the Austro-Hungarian Government on Oct. 7. From Germany the President required, as a condition precedent to negotiations, that "the military masters and monarchical autocrats of Germany" should be irrevocably deposed. To Austria-Hungary he intimated that in one particular he could no longer stand by the Fourteen Points. It was no longer sufficient that the Czechoslovaks and the Yugoslavs should be guaranteed autonomy within the Austro-Hungarian state. These peoples must now decide what action on the part of Austria-Hungary would satisfy their aspirations. A republican Germany and a partition of Austria-Hungary were thus indicated as fundamental conditions of the peace. The Central Empires accepted the fiat; and the European Allies then agreed to make peace with Germany "on the terms of peace laid down in the President's Address to Congress and the principles enunciated in his subsequent addresses," with two qualifications. They reserved judgment on the second of the Fourteen Points "relating to what is commonly known as the freedom of the seas." They pointed out that, in their opinion, the President's demand for the "restoration" of territories invaded by Germany should be understood to include "compensation for all damage done to the civilian population of the Allies and their property by the aggression of Germany by land, by sea and from the air." The President accepted explicitly this meaning of "restoration," and accepted *ex silentio* the demurrer as to the "freedom of the seas." After the Conference had begun, he stated to some American journalists (Feb. 14 1919) that the freedom of the seas was no longer needed, as in future (with a League of Nations in existence) there would be no neutrals. It will be noted that the reply of the Allies to the President only committed them with regard to the German treaty. The armistices signed by Austria (Nov. 3 1918) and Hungary (Nov. 13) were unconditional, and the Italian Government afterwards held that neither of these countries was entitled to the benefit of the Wilsonian terms. But the legal point was not pressed by the Allies in general, even against Bulgaria and Turkey with whom Mr. Wilson had not negotiated at all. The general view was that Germany had negotiated on behalf of both herself and her Allies; and indeed the Wilsonian terms which Germany accepted made explicit references both to Austria-Hungary and to Turkey.

Purport of the Wilsonian Terms.—The general principles contained in Mr. Wilson's manifestoes were not all of the kind that a Peace Conference could enforce or promote. Some were principles of international morality; others could hardly be realized in a world which was still convulsed by national and racial animosities, by the sense of intolerable wrongs and of crushing disillusionments. The time was not yet ripe for insisting that the victors, equally with the vanquished, should abstain from "private international understandings of any kind," should throw down all "economic barriers" and should guarantee "equality of trade conditions" (most favoured nation treatment) to their former enemies. Still less could the Allies agree at that date to give "adequate guarantees" that their armaments should be "reduced to the lowest point consistent with domestic safety" within any definite period of time. It was easier for the Allies to accept some other principles which made a strong appeal to the moral sense of mankind: as, for instance, that nations ought to be governed in their foreign policy by the rules of private honour and by respect for the common law of civilized society; that "every part of the final settlement must be based upon the essential justice of that particular case, and upon such adjustments as are most likely to bring a peace that will be permanent"; and that "no

special or separate interest of any single nation, or any group of nations, can be made the basis of any part of the settlement which is not consistent with the common interest of all." These, and other similar rules, were valuable as a statement of the spirit in which the wiser heads of the Conference would approach their work. But the Conference could hardly do more for the propagation of Mr. Wilson's ideals than it did in approving the Anglo-American scheme of a League of Nations "formed under specific covenants" to ensure that "the combined power of free nations will check every invasion of right." When it provided that the Covenant of the League should form an integral part of each of the new treaties, and when it made the League responsible for supervising and revising many parts of the peace settlement, the Conference loyally accepted the conception of the League which Mr. Wilson had explained in his address of Sept. 27 and in several speeches of his European tour (Dec. 1918-Jan. 1919). The League was planned to be, as he had said at the Guildhall in London on Dec. 28, a permanent concert of Powers for the maintenance of the peace terms. It is easy now to blame the Allies for assuming that the Covenant, drafted by Lord Robert Cecil and Gen. Smuts in consultation with Mr. Wilson and Col. House, would be accepted without demur by the U.S. Senate. But their attitude towards the project of the League, when it was under discussion at the Conference, at least proves them honestly desirous of realizing Mr. Wilson's aspirations.

The territorial terms which Mr. Wilson had formulated were comparatively simple, though not always easy to reconcile with his principle of self-determination, which required that "every question whether of territory or of sovereignty, of economic arrangement or of political relationship" should be settled on the basis of "the free acceptance of that settlement by the people immediately concerned." Mr. Wilson himself subsequently confessed that, when he put self-determination on his programme (in spite of Mr. Lansing's fruitless objections, since revealed), he did so in ignorance of the very existence of some of the nationalities which afterwards invoked his aid. Literally and unconditionally applied, the principle of self-determination would have reduced eastern Europe to a chaos of privileged enclaves and economically helpless states; nor was it easy to see how it could be applied with any useful results to the German colonies or to the non-Turkish portions of the Ottoman Empire. The first of these two difficult cases was hardly met by Mr. Wilson's demand (in the Fourteen Points) that colonial questions should be settled with equal regard to the interests of the populations concerned and to the equitable claims of the Government whose title was to be determined. The solution eventually applied to both cases was that of mandates, a device first suggested by Gen. Smuts in Dec. 1918, and readily endorsed by Mr. Wilson when it was brought to his notice. As for the minor European nationalities, Mr. Wilson himself had already, before the Conference, indicated that their aspirations could not in every case be satisfied "without introducing new or perpetuating old elements of discord and antagonism that would be likely in time to break the peace of Europe and consequently of the world." This at least made it clear that a plebiscite would not be assumed to be in every case the one unailing criterion of the justice of national claims.

The following is a brief summary of the territorial terms to which the Allied and Associated Powers were committed by the pre-Armistice negotiations: (1) Germany was to evacuate all Russian territory, and (2) to recognize the independence of all territories inhabited by indisputably Polish populations. (3) Belgium and the occupied territories of France, Rumania, Serbia and Montenegro were to be evacuated. (4) Belgium was to be left in the position of a sovereign state. (5) Alsace and Lorraine were to be returned to France. (6) Poland and Serbia were to be given free and secure access to the sea. (7) The independence and territorial integrity of Poland and the Balkan states were to be assured by international guarantees. (8) The Turkish portions of the Ottoman Empire were to be allowed

to form a sovereign state; but the Straits were to be placed under international control, and the non-Turkish nationalities were to be allowed "an absolutely unmolested opportunity of autonomous development." (9) The Czechoslovaks and the Yugoslavs within the Austro-Hungarian Monarchy were to determine their own political destiny. We may further mention Mr. Wilson's Ninth Point, demanding a readjustment of the frontiers of Italy along "clearly recognizable lines of nationality." To this limitation of Italy's ambitions Sig. Orlando had never agreed. But his protest was not, unluckily, made public till May 1919.

Opening of the Conference.—The invitations to the Conference were issued by the five principal and associated Powers, whose chief plenipotentiaries held consultations in Dec. and the early days of Jan. 1919, before they formally assembled at Paris. Mr. Wilson was in Paris from Dec. 13 to Dec. 25, in England from Dec. 26 to Dec. 31, in Italy from Jan. 3 to Jan. 6. M. Clemenceau, Sig. Orlando and Baron Sonnino visited London early in December. Finally, on Jan. 12, there took place at the Quai d'Orsay a meeting of the Supreme War Council (a body constituted in Nov. 1917) which was attended by Mr. Wilson and Mr. Lansing, M. Clemenceau and M. Pichon, Mr. Lloyd George and Mr. Balfour, Sig. Orlando and Baron Sonnino. On this occasion it was decided that only the representatives of the five chief Allied and Associated Powers (the fifth being Japan) should be entitled to attend all meetings of the Conference, and that other members should be summoned only when their special interests were involved in the discussion. The decision was taken without the other Allied and Associated Powers being consulted, but was in harmony with the practice of the Congress of Vienna (1815), and was defended on the ground that the five were "Powers with general interests." Membership of the Conference was accorded to 32 Powers in all. Enemy Powers were not admitted, and neutral Powers were only to attend, when specially summoned by the five, at sessions specially appropriated to the discussion of their claims. But all belligerents, and all Powers who had severed diplomatic relations with Germany, were entitled to appear at every plenary session. It had been originally proposed to put all "new states in process of formation" on the same footing as the neutrals with special interests. But the right of Poland and of Czechoslovakia to be represented in the Conference was conceded before the first plenary session. Croats and Slovenians were in fact represented by the Serbians, but the enlarged kingdom of Serbia, owing to the opposition of Italy, was not officially recognized until the end of May. The five principal Powers settled the number of plenipotentiaries by whom each state might be represented, with special regard to the military importance of each Power and to the part which it had played in the war. The number of plenipotentiaries was a question of sentiment only, since no Power exercised more than one vote; but the question was not settled without some bickering. Finally five plenipotentiaries were assigned to each of the principal Powers; three apiece to Belgium, Brazil and Serbia; two apiece to Canada, Australia, South Africa, India, China, Czechoslovakia, Greece, the Hejaz, Poland, Portugal, Rumania, Siam; one apiece to New Zealand, Bolivia, Cuba, Ecuador, Guatemala, Haiti, Honduras, Liberia, Nicaragua, Panama, Peru, Uruguay. All the Powers were allowed to make use of the panel system in choosing their plenipotentiaries, and the representatives of the British Dominions did important work on more than one occasion by virtue of their position on the panel of the British Empire. These arrangements were complete before the first plenary session (Jan. 18), which was merely asked to transact some formal business, on lines settled in advance by the Five. It elected M. Clemenceau as president of the Conference; it sanctioned the appointment of a secretary and also of a drafting committee on which the Five alone were represented. At the second plenary session (Jan. 25) one of the minor Powers, Belgium and Canada amongst the rest, tested against the degree of control which the Five had over the proceedings of the Conference. These pro-

bluntly answered by M. Clemenceau; but they could not be altogether ignored. The smaller Allies were by degrees allowed a larger representation on some of the commissions and committees; and in this way a use was found for the abilities and experience of some highly distinguished statesmen, such as M. Venizelos.

Organization and Procedure.—The original rules of procedure, drafted by M. Berthelot, do not throw much light on the methods of transacting business which were actually employed, and in some points they were quickly modified.¹ The conduct of affairs, until March 25, was in the hands of the Council of Ten, a body composed of two plenipotentiaries for each of the five Powers; it was simply the Supreme War Council adapted to new purposes. The plenipotentiaries were allowed to bring their expert advisers with them, and made free use of this permission; but the Council from the first availed itself of the power, accorded under rule 13, to refer technical questions to committees of experts. The proceedings of the Ten were secret; rule 8 provided for the publication of official *communiqués*, but these were usually so worded as to convey the minimum of information. Owing to the large numbers present at each session, the secrecy of the proceedings was seldom respected; and, while the unofficial reports published in the French press were severely censored, the correspondents of English and (more particularly) American papers were often successful in acquiring and transmitting important information. On Jan. 17 the Ten promised, in answering a protest from the correspondents, that the plenary sessions should be open to them, except in special cases. But these sessions were infrequent and, when they were open to the press, only transacted formal business.

Those of May 6 and May 31, at which important differences of opinion became manifest, were held behind closed doors. The secrecy of the deliberations grew more complete after March 25, when the Council of Ten was superseded by the Council of Four (Mr. Wilson, M. Clemenceau, Mr. Lloyd George, Sig. Orlando). Thenceforward experts were merely summoned to answer questions; for over three weeks the only official continuously present was the interpreter (M. Mantoux); but in April Sir Maurice Hankey was admitted as secretary. The Four delegated certain questions to a council of five foreign ministers (Mr. Lansing, M. Pichon, Mr. Balfour, Baron Sonnino, Baron Makino), but this body did not become prominent until the end of June when the Four dispersed and left all current business to be transacted by the Five.

Each of the principal Powers, except France, provided its plenipotentiaries with a large staff of officials and other experts. These "delegations" served as panels from which was drawn the personnel of the innumerable commissions and committees appointed from time to time by the plenary sessions or by the Supreme Council.² Most of the earlier commissions were large and imposing bodies; each of the principal Powers contributed two or three representatives to each commission, while the other Powers were allowed to send, between them, five or ten. This was the constitution of the commissions on Reparations, on the Responsibility for the War, on the League of Nations, on International Labour Legislation, on Ports, Waterways and Railways, all of which were sanctioned by the second plenary conference (Jan. 25). In Feb. and March five territorial commissions were constituted. On these only the principal Powers were represented. The subjects referred to them were the territorial claims of: (1) the Czechoslovaks, (2) the Poles, (3) Rumania and the Yugoslavs, (4) Greece and Albania,

¹ English was recognized at the Conference as of full equality with French as the official language, so that all the proceedings were bilingual. The British Dominions were recognized not only as an integral part of the British Empire delegation (being, for instance, part of the panel from which British representatives on the Supreme Council were chosen), but also as states on an equality with other small independent states. Thus Gen. Botha and Gen. Smuts sometimes sat in the Supreme Council in one capacity and sometimes in the other.

² The "Supreme Council" was the generic name applied to whatever the Ten, the Four or the Five—happened to be in control of the proceedings.

(5) Belgium and Denmark. On Jan. 27 the Supreme Council appointed a large economic commission to draft the articles of the German treaty which related to such subjects as commercial relations, shipping, industrial property, pre-war contracts, and the liquidation of enemy debts. On Feb. 12 a naval and military committee, under Marshal Foch, was created to draft the terms relating to disarmament and the surrender of naval and military material. The Council of Four, like the Council of Ten, constantly employed expert committees, but showed a preference for comparatively small bodies which could be trusted to work with expedition.

For business not immediately connected with the making of treaties the Supreme Council made considerable use of the Armistice Commission at Spa, of the military staff of the old Supreme War Council at Versailles, and of the Supreme Economic Council at Paris. The last named of these bodies was instituted, at the instance of Mr. Wilson (Feb. 8) to advise the Conference on any economic measures of a temporary character which might be necessary to ensure: (a) that the devastated areas were duly supplied with the raw materials and other commodities required for purposes of reconstruction; (b) that the economic life of other countries which had suffered from the war was promptly revived; (c) that the pressing wants of neutral and ex-enemy countries were satisfied without detriment to the Allied and Associated Powers. The Supreme Economic Council absorbed many of the functions of those inter-Allied councils which, during the later stages of the war, had been charged with special problems of food supply and relief work, finance, shipping and blockade. It also formed special sub-sections to advise on the reorganizing of inland communications by rail and water, and on the control of the raw materials required for reconstruction. Lord Robert Cecil, representing Great Britain, usually presided at meetings of the Supreme Economic Council. Mr. Hoover, who was one of the American representatives, made himself responsible for the Food and Relief section, which had to deal with the most urgent of all the duties referred to the Council. From Feb. 17 to the end of June the activity of the Supreme Council was unremitting. It was expected to see to the revictualling of Germany under the terms of the Armistice Convention. It organized relief work among the starving populations of eastern Europe. It reorganized the derelict transport systems of Austria-Hungary and Poland. Its German duties involved negotiations with a German finance commission, and the arranging of the Brussels agreement (March 14) under which Germany was supplied with foodstuffs up to the end of Aug. 1919. It was by successive recommendations of this council that the commercial blockade of Germany was partially relaxed in Feb., March and April; the most striking of these recommendations was that subjects of Allied countries should be free to trade with Germany, subject to any restrictions which their respective Governments might desire to maintain (April 24). In April the Council undertook to supervise the economic life of the left bank of the Rhine, during the period of occupation. After the German treaty had been signed the Supreme Economic Council was still utilized by the European Allies as an agent for the purchasing of foodstuffs in America and supplying Austria with coal. The last meeting was at Rome in Nov. 1919.

The Council of Ten, Jan. 18 March 25 1919.—The first section of the German treaty to be drafted in something like its final form was the Covenant of the League of Nations, which Mr. Wilson consistently regarded as "in a sense the most essential part of the peace settlement." By the end of Jan. the American and British delegates had agreed upon a draft. This was carefully discussed in the first fortnight of Feb. by the League of Nations Commission, on which were represented not only the five Great Powers, but also Belgium, Brazil, China, Portugal, Serbia, Greece, Rumania, Poland and Czechoslovakia. The most prominent personages who served on the commission, after Mr. Wilson who was its president, were Col. House (U.S.A.), Lord Robert Cecil and Gen. Smuts (British Empire), M. Bourgeois (France), Sig. Orlando (Italy) and M. Venizelos

(Greece). The Covenant passed its first reading at the third plenary session (Feb. 14), but was amended in details before it was finally approved by the fifth plenary session (April 28). The amendments were chiefly inspired by the wish to meet American criticism. One provided that members of the League might withdraw on giving two years' notice; another expressly guarded the Monroe Doctrine from attack. Among amendments which were considered but rejected it is enough to mention: (a) a Japanese proposal that there should be a clause declaring all members of the League, without respect of race or colour, to be equal; (b) an American proposal to forbid any discrimination "in fiscal and economic regulations" between one nation and another (which would have put an end to *Zollvereins* and to imperial preference); (c) a French proposal to endow the League with a general staff and with powers to supervise the process of disarmament. (See LEAGUE OF NATIONS.)

To the same period belongs the main work of the Labour Commission, which began to draft the Labour Convention on Feb. 1. The Convention was intended to convince the world that the interests of labour would be better served by supporting the Allies at Paris than by helping German Socialists to draft their Labour charter in the International Conference which sat at Berne in Jan. and February. The Commission, first proposed by M. Clemenceau, had an American chairman (Mr. Gompers); among the other prominent members were Mr. Barnes (Great Britain) and M. Vandervelde (Belgium). It contained no elected representatives of labour, but conferred with a number of labour leaders who were specially invited to Paris for the purpose. Its work proceeded smoothly and swiftly. The Convention enumerates nine fundamental principles, for drafting which Mr. Gompers was responsible; but otherwise it refrains from any attempt at remedial legislation. It is mainly concerned with outlining the organization, powers and procedure of a Labour Conference (an international labour parliament) and a Labour Office (a bureau of experts). The Convention links up the Labour Conference with the League of Nations, and provides that the original members of the League shall also be the original members of the Conference. The German delegates proposed (in May 1910) that the Convention should be revised by a conference of trade unions, in the light of the German Labour charter and of the Berne resolutions. This proposal was however rejected; the Convention in its final form owes nothing to German amendments. It forms section 13 of the Treaty of Versailles, and appears in all the other treaties with enemy powers. The Labour Conference met for the first time at Washington in the autumn of 1919, but was attended by no American delegates, owing to the fact that the U.S. Senate had not yet ratified the Treaty of Versailles. (See INTERNATIONAL LABOUR.)

The Labour Convention was not presented to the Conference until April 1, and for some weeks after the third plenary session (Feb. 14) it seemed as though the Ten and their satellitic commissions were making little progress. This impression was strengthened by the temporary absence of Mr. Lloyd George (Feb. 7-March 5) and of Mr. Wilson (Feb. 14-March 14), who departed on urgent business of different kinds to London and to Washington respectively. For a time the Supreme Council was also robbed of M. Clemenceau; he was wounded on Feb. 19 by a French anarchist and was not seen again in public until March 10. But in any case the Supreme Council was at this stage burdened with a mass of formal duties which could not be avoided or postponed. It was necessary, under the rules of procedure, to hear the views of the "members with special interests." Late in Jan. audiences were given to the claimants for the German colonies, among whom the British Dominions were conspicuous. Then came the turn of the minor Powers and the oppressed nationalities: Rumania, Greece, Czechoslovakia, the Hejaz, Belgium, the Syrians, the Druses, the Zionists, the Yugoslavs, Denmark, the Albanians, the Armenians and the Montenegrins. The ceremonial interviews rarely added anything to the case which had been already presented in writing; and all the claims, except those involving considerations of high policy, were referred, as the interviews concluded, to

the five territorial commissions, and to a central commission which was appointed (Feb. 27) to coördinate the conclusions of the territorial experts. On a few questions there was substantial progress. A provisional agreement was reached as to the future of the German colonies. A Financial Drafting Commission defined the questions of finance and reparation which must be settled by the experts. Between Feb. 12 and March 3 the Military and Naval Drafting Committee prepared the first draft of the naval and military terms, and early in March Mr. Lloyd George persuaded the Supreme Council to accept the principle that all the enemy Powers should be obliged to abolish compulsory military service. By March 10 the naval, military and air terms were practically complete and on March 17, when Mr. Lloyd George was contemplating another visit to London, Mr. Wilson, M. Clemenceau and Sig. Orlando sent him a joint letter, begging that he would remain in Paris for the fortnight which, in their opinion, was the time required for completing the German treaty. Mr. Lloyd George agreed, but on condition that a more expeditious and more secret procedure than that of the Ten was adopted. He carried his point; on March 25 an official notice was issued that informal discussions by the delegates of the principal Powers would be substituted for the methods hitherto adopted. With this announcement began the period of the Council of Four. The Marquis Saionji, who might have claimed a seat in this conclave, abstained from doing so, except when Japanese interests were involved, on the ground of his ignorance of European languages.

Council of Four, March 25-May 7.—The Four worked at high pressure to complete the German treaty. They met two or three times a day; they confined their discussions to matters of principle and high policy; they left questions of detail and all technical subjects to the experts. But there were delicate and urgent problems, not all vitally connected with the treaty, which came up at many sessions, and some of these were never finally settled at Paris. The Four could never concentrate on one subject, to the exclusion of all others, until a definite agreement was reached; for each stage in a particular discussion involved a further reference to the experts, and a longer or shorter delay until the experts were ready with their report. Hence a chronological record of their debates, if such were available, would be a bewildering document. But it is known what were the more contentious topics debated in these six weeks, and what were the main issues in each case.

(a) The *guarantees* for Germany's compliance with the treaty were a special anxiety to France. She asked that there should be a prolonged occupation of the left bank of the Rhine by French, British and American forces; that the Rhine bridge-heads (Cologne, Coblenz and Mainz) should be included in the zone of occupation; that the left bank should be permanently detached from Germany to form a neutral and autonomous state ("Rhineland Republic"). Great Britain and America had offered France defensive treaties (the "Three Power Treaty") in lieu of these cumbrous precautions (March 14). M. Clemenceau accepted the treaties, but also pressed for the adoption of the French scheme. His colleagues would not hear of a Rhineland Republic; but they agreed that the left bank, and a deep belt on the right bank, should be denuded of fortifications (Art. 180); and, more reluctantly, that there should be joint occupation for 15 years. Still another concession was extracted from them—the last clause of Art. 420, which provided that, even at the end of 15 years, the occupation may be continued if in the opinion of the Allies France is insufficiently guaranteed against an unprovoked attack. This clause was intended to provide for the contingency of the British or the American defensive treaty being still unratified at that date.

(b) The *Saar valley* was claimed by France in compensation for her ruined mines. At first she had asked for complete political sovereignty on historical grounds; but this solution, which involved the subjection of 650,000 Germans to French rule, was rejected by her Allies, who would not even restore to French frontier of 1814 in this region. But they conceded her the Saar coal-mines in full ownership, and, not with-

hesitation, agreed that for 15 years the Saar valley should be withdrawn from the control of Germany and placed under the League of Nations. At the end of that time the inhabitants were to decide between three alternatives—the *status quo*, union with France, union with Germany. If they voted for Germany, then France was to receive the price of the mines from Germany or from the Reparations Commission.

(c) The *Reparations Clauses* were also of special interest to France. Her representatives insisted passionately on "integral reparation," the assessment of the damage actually done by Germany and by her allies, and the exaction of the utmost farthing. How otherwise, they asked, could France escape bankruptcy? Many English and American experts were impressed by the exhaustion of Germany, the danger of driving her to desperation, the unwisdom of leaving her liability indeterminate for the many months which would pass before a complete bill for damages could be presented; and they pressed for taking in final quitance whatever sum (20 or 40 milliards of marks at most) Germany could be compelled to pay at once. The French view prevailed, but there was another battle over the categories of damage, and Mr. Wilson was persuaded only with great difficulty to admit that pensions and allowances to combatants and to their families came within the terms of his pre-Armistice conditions. There were further debates on the capacity of Germany to pay and on the sum for which she might conceivably be liable. In the end the extent both of her legal liability and of the sum to be actually paid was left for future definition. Germany was to pay 20 milliards of gold marks in cash and kind by May 1 1921; and out of this sum the Allies would pay for any foodstuffs or raw materials which they considered indispensable to Germany. Two further sums, each of 40 milliards, were to be exacted later, bringing the total to 100 milliards; but this, in the words of the treaty, was only "a first instalment." The final account would be presented by the Reparations Commission before May 1 1921, and would be paid off by degrees over a period of 30 years, with interest at 5 per cent. On Sept. 5 1919 the French Minister of Finance encouraged the Chamber to expect that 300 milliards might be extracted from Germany. In Jan. 1921 the European Allies agreed to exact one-third of this sum, payable with interest over 40 years, and supplemented by a tax of 12 per cent *ad valorem* on German exports. This was rejected by Germany, but at the end of April the Allies presented an ultimatum which was accepted.

(d) The delimitation of the western frontier of Poland was not effected without serious debates. France desired to treat Poland liberally. Great Britain was impressed with the risk of creating a new *Germania irredenta* to trouble the peace of eastern Europe. The experts were anxious that due weight should be given to Mr. Wilson's Thirteenth Point, which stipulated that Poland should have a free and secure access to the sea. Poland (supported by France) asked for full sovereignty over Danzig and the approaches to that city. But the population of Danzig was almost wholly German, and the frontier demanded by Poland would have left 2,000,000 Germans under Polish rule—a solution which Mr. Lloyd George considered inadmissible. Thanks to Mr. Lloyd George a compromise was at last arranged which left Danzig a free city under the protection of the League of Nations with a very exiguous degree of freedom. The Polish frontier, in this compromise, was still drawn with more regard to the economic interests of Poland than to the rights of nationalities. But, before the German treaty was signed, the frontier was again modified, and other changes were introduced, in deference to the expostulations of the German delegates; in particular it was determined that in Upper Silesia a plebiscite should be held.

(e) *Shantung* was demanded by the Japanese plenipotentiaries under the treaties which China had concluded with Japan in 1915, but which, according to the Chinese plenipotentiaries, had been extorted by *force majeure*; also under a secret agreement of 1917 with the European Allies, to which the United States had never adhered. For a long time Mr. Wilson

resisted the Japanese claim, but he finally accepted (April 30 1919) a compromise which the Chinese regarded with so much disfavour that they declined to sign the German treaty. The Japanese were allowed to keep the town of Kiaochow with the adjacent district, and the right of exploiting the mines and the railways in the Shantung peninsula; but they gave an oral understanding that they would restore the sovereignty of the peninsula to China "as soon as possible." Mr. Wilson subsequently (Aug. 19) told a committee of the American Senate that he would have preferred a different solution. But the Japanese claim was pressed at a time when Italy seemed on the point of seceding from the Conference; and a second secession would have made it difficult to conclude any treaty with the Germans.

(f) The *Italian claims* to Austro-Hungarian territories were continually under discussion during April. They were primarily founded on the Treaty of London; but Sig. Orlando claimed Fiume also, taking his stand in this case on the right of self-determination which he otherwise repudiated. Mr. Wilson at first argued that the Treaty of London was incompatible with the principle, enunciated in the Fourteen Points, that "a readjustment of the frontiers of Italy should be effected along clearly recognizable lines of nationality" (Point Nine). But Sig. Orlando objected that Italy was not bound by this principle, against which he himself had twice protested in the Supreme War Council, when the terms of the German Armistice were under discussion. His protests had been overruled at that time, on the ground that they were irrelevant to the discussions with Germany; but he had reserved the right to dispute Point Nine, and he asserted this right to the fullest extent in April. On April 14 Mr. Wilson gave way to the extent of intimating that he would accept the northern (Brenner) frontier assigned to Italy by the Treaty of London, and would admit Italy's claim (based on the same treaty) to Lissa and Valona; but he required that Fiume, as the natural outlet for the trade of Yugoslavia and Austria, should be made a free city within the Yugoslav customs area, and he held that, as regarded Dalmatia, Italy ought to be content with guarantees for the rights of the Italian minorities living in that province. Subsequently he rejected a proposal, made by M. Clemenceau and Mr. Lloyd George, that Italy should be awarded Fiume in exchange for a renunciation of her treaty claims upon Dalmatia; on April 20 he declined to discuss the Adriatic problem any further; and on the 23rd he created a sensation by publishing a statement of the grounds on which he resisted the Italian pretensions. Next day Sig. Orlando left the Conference, and Baron Sonnino followed him within 24 hours. On April 29 the Italian Chamber, after hearing Orlando's account of the negotiations, reaffirmed his definition of the Italian claims by an overwhelming majority. On April 30 the German delegates arrived at Versailles and the Council of Four (now reduced to three) had to face the possibility that Italy would not sign the treaty; at this time was drafted the ratification clause which stipulates that the treaty shall come into force as soon as ratified by Germany and any three of the principal Powers. But on May 4 Orlando relented. He and his colleagues reached Paris on May 7, a day too late for the sixth plenary session which approved the draft treaty, but a few hours before the draft was handed to the Germans at Versailles. The Council had not surrendered to Italy on the Adriatic question, but it was left open for future discussion.

The Draft Treaty and the German Delegates.—Two considerable sections of the treaty, the Covenant of the League and the Labour Convention, had been finally approved on April 28 by the fifth plenary session without much debate; the chief feature of the proceedings was that Baron Makino and M. Bourgeois expressed regret that the commission had not seen fit to accept the Japanese and French amendments. The sixth plenary session (May 6), which was held in secret to approve the treaty as a whole, revealed more serious differences. The Chinese protested against the Shantung clauses, the Portuguese against the African settlement, and Marshal Foch argued that the military guarantees for the submission of Germany were inadequate. His objection was met, to a certain extent, by the announcement,

on May 7, that the United States and Great Britain were prepared to sign treaties with France, guaranteeing her against German aggression. But the session of May 6 was remarkable for the strong undercurrent of dissatisfaction among the minor Powers "with special interests" (including the British Dominions) who felt that their views had not been sufficiently considered. On May 7 at the Trianon the Conference saw the draft treaty handed to Count Brockdorff-Rantzau, the principal German delegate, and heard him deliver, without rising from his chair, a sharp attack upon their dilatory methods. He stated that, in the past six months, the blockade had been responsible for hundreds of thousands of deaths in Germany. "Think of that when you speak of guilt and punishment." He and his countrymen accepted the liabilities to which they were committed by the Armistice and Mr. Wilson's terms. They were prepared to play their part in restoring Belgium and the devastated areas of France. But he intimated that Germany did not hope for a just peace. "We are under no illusions as to the extent of our defeat and the degree of our helplessness; . . . we know the power of the hatred that we encounter here."

Fifteen days were allowed the Germans for preparing their reply, but the term of grace was eventually extended to May 29. The German delegates, to expedite the negotiations, transmitted their criticisms by instalments, each dealing with one topic (League of Nations, Labour Charter, Saar Valley, etc.); in some cases they tendered several notes successively on the same subject. The Supreme Council had arranged that these notes should be considered by 13 committees, each of which was specially responsible for one section of the treaty, and interim replies were returned to the Germans very promptly. Consequently much of the disputed ground had been covered in preliminary correspondence before the German counter-proposals were presented as a whole; and M. Clemenceau was able to dispatch the reply of the Allies on June 16. Both documents were polemical in character. The Germans, besides criticising many particular articles of the draft treaty, argued that its general tenor was inconsistent with the terms of the pre-Armistice agreement; and the Allies repudiated this imputation with some heat. The main criticisms of the Germans are noted below. Their counter-proposals were numerous, and only the more striking can be given here: (a) *Reparation*.—They offered to pay a sum not exceeding 100 milliards of gold marks, partly in gold but mainly in commodities and services; but they claimed the right of appeal from the assessment of the Reparations Committee to a neutral arbitrator. They would pay the first 20 milliards by May 1 1926; but they claimed credit for all war material surrendered under the Armistice conditions, for state railways and state property ceded along with Alsace-Lorraine and the colonies, and for the share of the German public debts which, as they maintained, these territories ought to bear. No definite period was fixed for the payment of the remaining 80 milliards, though it was stated that Germany would allocate to this purpose annually a sum equal to the average *net* peace budget of the empire before the war and it was stipulated that no interest should be paid. (b) *Territorial*.—They demanded a plebiscite in Alsace-Lorraine which should give the inhabitants an option between union with France, union with Germany and complete independence. In lieu of the Saar valley they offered to France fixed annual supplies of coal, pending the reconstruction of the French mines. In lieu of ceding West Poland, Danzig and Memel they offered to make Danzig, Königsberg and Memel free ports (under German sovereignty). They demanded that Germany's claim to keep her colonies should be referred to arbitration. (c) *Commercial*.—They offered to the Allies "most favoured nation" treatment in German markets for a restricted number of years, upon condition of complete reciprocity; and "national" treatment to Allied goods passing over German railways (without a time limit) on the same condition. (d) *League of Nations*.—They offered to negotiate on this subject, taking the Allies' draft covenant as a basis. But, as conditions precedent to negotiation, they demanded that Germany should be admitted immediately to the League;

that members of the League should be pledged to abstain from waging economic war; that the Allied Powers should, within two years, abolish compulsory military service and themselves disarm. (e) *Occupied Territory*.—They proposed that the armies of occupation should be withdrawn within six months after the signing of the treaty.

These proposals constituted a manifesto addressed to the public outside the Conference; but in some particulars they agreed with proposals which had been forcibly argued in the innermost circles of the plenipotentiaries. M. Tardieu and Mr. Wilson Harris have both stated, apparently on good authority, that the idea of mitigating the treaty in essential details was before the Supreme Council at various dates from May 23 to June 13, and that one reason for these discussions was a doubt whether the treaty, as it stood, could be enforced on a recalcitrant Germany. Mr. Lloyd George was now the spokesman of the critics; among these were counted the leading members of his Ministry, who, together with Dominion representatives, had been summoned to a special meeting at Paris on June 1. He protested against the idea of maintaining a large army of occupation for a considerable time. He was now (for a short while at least) in favour of a fixed indemnity; he advocated revision of the Polish frontier and the early admission of Germany to the League of Nations. But it was hardly possible to rewrite the treaty at this stage; the dangers of further delay were too serious to be lightly accepted. On June 13 the movement for revision came to an end. Its only consequences were some concessions on secondary points. On Reparation and Military Occupation the Allies stood by their original draft. They conceded some slight changes in the Polish frontier with the object of bringing it "into closer harmony with the ethnographic division." They agreed to a plebiscite in Upper Silesia. They intimated that they were opening negotiations at once for an eventual reduction of their own armaments. They withdrew a provision for internationalizing the Kiel canal. They promised that Germany, if she complied with the terms of the treaty, should be admitted to the League of Nations "in the early future." They invited Germany to offer, within four months of the signing of the treaty, a lump sum in settlement of the whole bill for reparation, but this suggestion was not accepted.

Signing of the Treaties of Versailles, June 28.—All arrangements had been made for a general advance of the Armies of Occupation in case the German Government refused to sign the treaty, and there were a few days of suspense while Count Brockdorff-Rantzau was conferring with his colleagues at Weimar. On June 20 the Scheidemann Cabinet resigned, ostensibly because it would not consent to sign, but actually from a well-founded consciousness that it no longer commanded the confidence of the German Labour party. On June 21 a new Premier, Herr Bauer, offered to sign on conditions: he stated that the articles requiring the surrender of war criminals and those declaring Germany to be the sole author of the war must be omitted. He was told that conditions could not be accepted, and on June 22 obtained the leave of the Weimar National Assembly to sign unconditionally. Formal assurances to this effect were given on June 23 at Versailles, through Herr Haimhausen who, on the previous day, had succeeded Brockdorff-Rantzau as head of the German delegation. During the last days of suspense the German warships interned at Scapa Flow were sunk by their commanders, acting, it was stated, on orders from the German Admiralty (June 21).

The new German Minister for Foreign Affairs, Herr Hermann Müller, and his colleague Dr. Bell signed the treaty on June 28 in the Salle des Glaces at Versailles in the presence of all the plenipotentiaries, except those of China, who absented themselves to emphasize their protest of May 6 against the Shantung articles. Before and after this ceremony several subsidiary treaties were signed: (a) Defensive treaties with France, Great Britain and the United States, undertaking to deter France against unprovoked aggression. The British treaty was ratified by Great Britain on Nov. 20 1919, but it had to become binding until the American treaty should be

PEACE CONFERENCE

and since American ratification was subsequently refused (*see UNITED STATES: History*), the British treaty became a dead letter. (b) A protocol defining certain ambiguous conditions in the German treaty. (c) An agreement between the United States, Belgium, the British Empire, France and Germany, which defines the nature of the military occupation of the Rhineland. (d) The Polish minorities treaty by which Poland contracts with the Allies and with Germany to respect the civil and political rights of racial and religious minorities within her jurisdiction. The idea of imposing such a treaty was first laid before the Conference by Jewish associations, whose fears were excited by the reports of Polish pogroms in the winter of 1918-9; but it was also of great importance for the protection of German and other non-Polish minorities. Similar treaties were afterwards concluded by the principal Powers with Czechoslovakia, with Rumania and with Yugoslavia. The main Treaty of Versailles was ratified by President Ebert, on behalf of Germany, on July 10; by the King of Italy, by King George V. and by President Poincaré in Oct. 1919. But it was not till Jan. 10 1920, when Germany at last signed a protocol agreeing to give compensation for the ships which had been scuttled at Scapa Flow, that the final exchange of ratifications took place at Paris, and the state of war between the European Allies (but not the United States) and Germany was formally terminated.

Treaty of Versailles—Territorial Terms.—Germany surrenders Alsace and Lorraine to France, free and quit of all public debts (Arts. 51, 55), and accepts the arrangements regarding the Saar basin which have been described above (Art. 45-50). Luxemburg ceases to form part of the German *Zollverein*, and Germany renounces all rights over the railways in Luxemburg (Art. 40). Belgium receives Moresnet *neutre* and part of Prussian Moresnet (Arts. 32, 33); also Eupen and Malmédy (Art. 34) subject to the result of a plebiscite, which was held in Sept. 1920 and resulted in the final reunion of these districts to Belgium, by whom they had been continuously claimed since 1815. These acquisitions give Belgium some valuable forests and railway stations and a population of about 70,000 souls. The frontier between Germany and Denmark is to be settled in accordance with the wishes of the population (Art. 109); these were ascertained by plebiscites held in North Schleswig (Feb. 10 1920) and in Central Schleswig (March 14 1920) when the former district voted for reunion with Denmark and the latter voted for Germany. Under Art. 87 Germany recognizes the complete independence of Poland and surrenders Danzig together with the territories received by Prussia under the partitions of Poland (Posnanian, W. Prussia) and part of Middle Silesia; in 1910 these districts had a population of 2,931,000 souls of whom 1,087,000 were Germans. Article 88 provides for the plebiscite in Upper Silesia which had been conceded on June 16 1919; the voting (March 21 1921) seemed to prove that this clause was a concession of substance, and the subsequent award of the League of Nations (Oct. 1921), in favour of Poland, was correspondingly disappointing to Germany. By Arts. 94 and 96 plebiscites are ordered for the Masurenland region of East Prussia, and the West Prussian *Kreise* of Stuhm, Marienburg, Marienwerder and Rosenberg; in July 1920 both plebiscites produced substantial majorities for Germany. By Art. 99 Memel with the adjacent territory (total pop. 122,000 souls) is detached from East Prussia and put at the disposal of the principal Powers, who intended that Memel should be the port of Lithuania but had not, up to May 1921, given effect to that intention. Article 100 similarly assigns Danzig (pop. 200,000) to the principal Powers, who (in accordance with this Article) have recognized Danzig as a free city with an elected legislature under a high commissioner appointed by the League of Nations. But Poland will control the Vistula and the main railways within the territory of Danzig, and will be responsible for the foreign relations of the city, which is also to be brought within the Polish customs area (Art. 104).

Under Art. 156 Germany abandons to Japan her rights in the Chantung peninsula; she also renounces her concessions in

Hankow and Tientsin (Art. 132), her privileges in Egypt under the Capitulations (Art. 147) and all her treaty rights in Morocco (Art. 141). By Art. 119 she renounces in favour of the principal Powers all her overseas possessions. These, in accordance with Art. 22 of the Covenant of the League of Nations, will be administered by mandatories of the League. The Supreme Council made, on May 6 1919, a provisional distribution of mandates for the German colonies. German E. Africa was allotted to Great Britain, by whom it was renamed Kenya Colony (July 8 1920); but on May 30 1919, Great Britain resigned the districts of Urundi and Ruanda, which border on the Belgian Congo, to be held by Belgium under a separate mandate. German S.W. Africa went to the Dominion of South Africa. France and Great Britain received a joint mandate for Togoland and Cameroon, with permission to delimit their respective jurisdictions by mutual agreement. German New Guinea was entrusted to Australia, German Samoa to New Zealand, the island of Nauru (a rich source of phosphates) to Great Britain, the German islands in the North Pacific to Japan. But the United States subsequently announced (Feb. 21 1921) that Mr. Wilson did not agree to the island of Yap, an important cable station, being included in the Japanese mandate, and this question was one of the matters considered at the Washington Conference. (*See WASHINGTON CONFERENCE.*)

Treaty of Versailles—Reparations and Financial and Commercial Terms.—The articles of the treaty which define the sums to be paid by Germany have been epitomized above. The annexes to the Reparations section specify some of the payments in kind which Germany is to make immediately on account of reparation: (a) She is to surrender all her merchant ships of 1,600 tons gross and upward; one-half of her merchant ships between 1,600 and 1,000 tons gross; also one-quarter of her fishing fleet and a proportion not exceeding one-fifth of her river craft. By Feb. 10 1920 she had surrendered vessels of over 1,000 tons amounting to 1,824,828 tons gross. (b) She is to furnish live stock, machinery, equipment, tools and building materials for the reconstruction of devastated areas. (c) During the next 10 years she is to find annually 7,000,000 tons of coal for France, 8,000,000 tons for Belgium, and for Italy deliveries amounting on the average to 8,000,000 tons per annum. Also she is to make good the difference between the actual output of the French pits in the Nord and Pas de Calais and their pre-war average output. But, since May 1920, her total liability for coal has been reduced to 2,000,000 tons a month. According to the Conference note of June 16 1919, the Germans might terminate this system of payment in kind as soon as they pleased after May 1 1921. "If Germany raises the money required in her own way, the Reparations Commission cannot order that it shall be raised in some other way."

The Reparations Commission is a body appointed, under Art. 233, with the duties of estimating Germany's liabilities and her capacity to pay, of insisting on the due performance of her obligations to pay in gold and in kind, and of seeing that the German scheme of taxation "is fully as heavy proportionately as that of any of the Powers represented on the Commission." The Commission is to consist of seven delegates representing the principal Powers, Belgium and Yugoslavia; but no more than five of these may vote at any meeting. The United States, Great Britain, France and Italy have a vote on every occasion; Japan and Yugoslavia only vote when their special interests are concerned; Belgium votes when neither Japan nor Yugoslavia is entitled to do so. On certain questions the unanimous vote of the meeting is required to make the decision valid; as, for instance, on the question of cancelling the whole or any part of the debt or obligations of Germany. The powers assigned to the Commission were severely criticised at the Conference by the German delegates, who said that they were greater than those which any German emperor had ever possessed in Germany. It remained, however, to be seen how those powers would be utilized afterwards. The Commission has considerable powers under the other treaties, being made responsible, directly or indirectly, for the execution of the Reparations

clauses in each; and it was conceivable that it might remain in existence for the next 42 years, or even longer.

The financial clauses provide that Germany shall pay the costs of the armies of occupation (Art. 249). They safeguard the right of the Allied and Associated Powers to dispose of enemy assets and property within their respective jurisdictions (Art. 252)—a clause of great importance since the German assets held by Great Britain exceeded £120,000,000 sterling, and those held by the United States exceeded \$500,000,000. On the other hand, ceded German territories, other than Alsace-Lorraine and the German colonies, are to be burdened with a due proportion of the German pre-war debt (Arts. 254, 255, 257). Germany transfers to the Allies any claims she may have to payment or repayment by Austria, Hungary, Bulgaria and Turkey (Art. 261).

The most striking feature of the commercial terms is that they impose on Germany a number of unilateral obligations for limited periods of time. For five years she must grant "most favoured nation" treatment to the Allies, in respect of both her imports and her exports (Arts. 264-7). For five years goods imported into Germany from Alsace-Lorraine, up to the average quantities of the years 1911-3, are to be free from German import duties; and imports from the ex-German provinces of Poland are similarly privileged for three years (Art. 268). The Allies may impose a special customs regime on the occupied territories "to safeguard the economic interests of the population" (Art. 270). For three years Germany may not raise the import duties on certain commodities (chiefly produced by Belgium and Italy) above the lowest rates to which these commodities were liable before July 31 1914 (Art. 269).

Treaty of Versailles—Military, Naval and Air Clauses.—Germany is required to abolish universal compulsory military service (Art. 173); her army is to be reduced, by a fixed date—which was originally March 31 1920, but subsequently altered to Jan. 1 1921—to a maximum total of 100,000 officers and men (Art. 160). The great general staff and all similar organizations are to be dissolved (*ib.*), and associations of all kinds are forbidden to instruct or exercise their members in the use of arms (Art. 177). The standing army is to be composed of volunteers recruited on a long-service system (Arts. 173-5). The stock of arms, munitions and military equipment which Germany may provide for this army is strictly limited; and the manufacture of such materials may only be carried out in factories approved by the Allies (Art. 168). All such materials in excess of Germany's legitimate requirements are to be surrendered within two months after the treaty comes into force (Art. 169). Germany is required to destroy all fortifications on the right bank of the Rhine within a distance of 50 km. from the river, and in the whole of her territory on the left bank (Art. 180). The size of her navy is defined; she may not keep more than 6 battleships, 6 light cruisers, 12 destroyers and 12 torpedo-boats; no submarines are allowed (Art. 181). She is to surrender 8 battleships, 8 light cruisers, 42 destroyers and 50 torpedo-boats (Art. 185), all her submarines (Art. 188), all military and naval aeroplanes and dirigibles (Art. 202). Warships and submarines still under construction are to be broken up. Germany's air forces are to be entirely disbanded by Oct. 1 1919 (Art. 199). The personnel of her navy, including officers, is not to exceed 15,000, and is to be recruited on a long-service system (Arts. 183, 194). The execution of these terms will be supervised by inter-Allied Commissions of Control armed with full powers of inspection and investigation (Arts. 203-210).

Criticisms of the Treaty.—One of the earliest critics was Gen. Smuts, who signed the treaty on behalf of South Africa, and on the same day issued a statement in which he spoke of "territorial settlements that will need revision" and "indemnities stipulated which cannot be exacted without grave injury to the industrial revival of Europe." He said that he had signed "because the real work of making peace will only begin after this Treaty has been signed." Mr. J. M. Keynes, till June 10 the chief finance expert of the British delegation, has argued (in his book on *Economic Consequences of the Peace*, published

in Nov. 1919) that the claims of the Allies to reparation have been unjustifiably inflated by claims for separation allowances and pensions to the families of combatants, and for pensions and for compensation money paid to the wounded and disabled; and that the demands made on Germany are out of all relation to her capacity to pay. These points are naturally taken in the German counter-proposals of May 20, which accuse the Allies of desiring to fasten "a system of slave labour" upon Germany. "If," says this document, "they impose upon Germany a debt which robs her of every possibility of a future; if as a consequence every improvement of Germany's economic condition, which the German people might achieve by tireless diligence and Spartan thrift, would lead simply to this, that even greater payments for the discharge of this debt would be imposed upon us, then any delight in creative work, any spirit of initiative, would perish for all time in Germany." The experience of 1920 and 1921 showed that this prophecy was overdrawn, but it has suggested to more recent critics the reflection that the Allies might have obtained more, if they had demanded less. Experience has also shown the unreality of the terrifying picture which the Germans, and also Mr. Keynes, presented of the Reparations Commission as a despotic tribunal created "to exploit the labour of the German people for the benefit of the creditor states." Another subject which frequently recurs in the German note is that of the treatment accorded to German private property in the dominions of the Allies, in Alsace-Lorraine and in the German colonies. They objected to the general policy of liquidation and of referring the expropriated persons to the German Government for compensation. They argued that, by international law, private property ought to have been respected even during the war. They complained that the Allies reserved the right to liquidate German property in their own territories for an indefinite period after the war. They pointed out that Germany could only compensate the sufferers by printing more and more paper money, in which case "Germany with her currency constantly depreciating would be forced to flood the world market with goods at ridiculously low prices." But the greatest emphasis of all is laid on the complaint that the Allies, by the terms of their treaty, are violating the "innate rights of nation." The right of sovereignty is said to be infringed by the powers of the Reparations Commission and of the International Commission appointed to control the navigation of the Elbe, the Oder, the Niemen, the Rhine and the Upper Danube. The seizure of her colonies is represented as meaning that Germany is denied "the right and the duty to coöperate in the joint task which devolves upon civilized mankind of exploring the world scientifically and of educating the backward races." It is further alleged that the right of self-determination has been consistently overridden in the territorial settlement, inasmuch as the fate of the Saar valley (for 15 years), of Alsace-Lorraine, of Danzig and Memel, has been settled without a plebiscite, and Austria is virtually forbidden to throw in her lot with Germany, however greatly the populations concerned desire this union. On the topic of self-determination the Allies showed themselves particularly sensitive in their reply of June 16 1919. This principle, as we have seen, had already caused them some embarrassment; they had not all interpreted it alike; and Mr. Wilson himself had reluctantly waived its application in certain cases which were complicated by economic or strategical considerations. On the other hand the Allies absolutely declined to discuss the categories of damage for which they were demanding reparation, and merely asserted that this part of the treaty had been drafted "with scrupulous regard to the correspondence leading up to the Armistice of Nov. 11 1918."

The Austrian Treaty Negotiations.—The drafting of the Austrian treaty was begun some time before the German treaty had been signed, and the Austrian delegates arrived at Germain-en-Laye on May 14 1919. But there were unexpected delays in completing the first draft, which could not be submitted to the seventh plenary session until May 29. By the military, financial and reparation terms and p

political terms were reserved; and in this incomplete form the draft was handed (on June 2) to Dr. Renner, the principal Austrian delegate. On the same day the Serb-Croat-Slovene state (Yugoslavia) was formally recognized by France and Great Britain, who thus at length followed the example set by Mr. Wilson nearly four months before (Feb. 5). Even in its incomplete state the draft showed the great concessions which had been made, at Austria's expense, to Italy and to Czechoslovakia. By May 29 Mr. Wilson had withdrawn his opposition to the Italian claim (under the secret Treaty of London) for a frontier which touched the crest of the Brenner Pass and gave Italy 200,000 German subjects. The draft showed this frontier. It also showed that the 3,000,000 Germans living within the historic boundaries of Bohemia, Moravia and Slovakia were to be included in the Czechoslovak state. Against these arrangements the Austrian delegates protested in vain. They were more successful when they claimed the German districts of western Hungary as being not only German in sentiment but also economically indispensable to Austria ("the kitchen garden of Vienna") and her natural bulwark against unprovoked attacks from the side of Hungary. This claim was granted on July 20, perhaps the more readily because of the defiant attitude of Bela Kun, the leader of the Hungarian Bolsheviks, who was still in possession of Budapest. The Austrian delegates asked the permission of the Conference for a plebiscite in western Hungary, but were told that this formality was needless, the sympathies of the population being unmistakable. Nevertheless western Hungary was still in the hands of the Hungarian Government till the autumn of 1921. A smaller, but still valuable concession, was that which restored to Austria the important railway junction of Radkersburg, originally assigned to Yugoslavia. The draft ordered a plebiscite to be taken in the Klagenfurt basin, which was claimed on ethnological grounds by the Yugoslavs and had been forcibly occupied by Yugoslav troops. Though the administration of the basin was provisionally assigned to Austria, the Austrians appear to have assumed that the plebiscite would be so managed as to ensure the victory of their rivals at the polls; and they lodged some protests on this assumption, which in fact was falsified. When at last the plebiscite was held (Oct. 10 1920), it was found that the whole of the disputed area preferred to remain under Austrian rule.

In the course of the negotiations with the Austrian delegates it became clear that the principal Powers as a whole were far more leniently disposed to Austria than the form of the Austrian draft treaty appeared to suggest. The draft had been constructed on the same lines as the German treaty, and the effect of the Austrian reparation clauses was to convey an impression of greater severity than was in fact intended. As in the German treaty, so in the Austrian, the total sum to be demanded was left uncertain. Austria was required to pay, by May 1 1921, "a reasonable sum" which would be assessed by the Reparations Commission (Art. 181); and her remaining liability was to be defined by that body after that of Germany had been fixed (Art. 179). But, out of the "reasonable sum" to be paid in the first instance, the commission were to pay for any supplies of food and raw material which it deemed essential to Austria; and the Conference soon discovered that Austria was quite incapable of paying, either in gold or in kind, for the relief that she required and received. Austria was obliged to resign all claims to the merchant shipping owned by her nationals. She was required to find a quantity of live stock for the devastated areas of Italy, Yugoslavia and Rumania. But, in 1921, the Allies decided to waive all their outstanding claims against her on account of reparation. This act of grace makes it unnecessary to dwell upon the insistence with which the Supreme Council in 1919 emphasized their right to treat the new Austria—a state of 7,000,000 souls—as the legal heir to the liabilities of the Austrian Monarchy. The chief advantage which the principal Powers derived from this attitude was that of a legal title to dispose of the severed lands of the Austrian Monarchy. These lands the new Austria renounces (under Arts. 36, 47, 53, 59, 89 of the treaty) in favour of the beneficiaries appointed by the

Conference. Similarly she renounces the interests of the old Austria outside Europe (Arts. 95-117).

Several concessions, other than those enumerated above, were notified to the Austrian delegates between June 2 and the date of signature. (1) The Supreme Council promised to support Austria's claim to membership of the League of Nations as soon as she possessed a responsible Government which had both the will and the power to fulfil its international obligations. This promise was fulfilled, and Austria was admitted to the League late in 1920 at a session held in Geneva. (2) The Council also conceded that the property of Austrian nationals in the former territories of the Dual Monarchy should not be liable to detention or confiscation by the Governments of those territories (Art. 267). (3) They sanctioned a temporary system (to last for five years) of preferential customs duties between Austria on the one side and Hungary and Czechoslovakia on the other (Art. 222). (4) They reduced from five to three years the period during which the new states could claim "most favoured nation" treatment in Austria without reciprocity (Art. 232).

The second draft of the treaty was handed to the Austrian delegates on July 20 and was practically complete. The Austrians presented their final observations on Aug. 6; the Supreme Council gave its final reply on Sept. 2. On Sept. 8 the Austrian National Assembly, while protesting against the terms, authorized its delegates to sign; and this ceremony took place at St. Germain-en-Laye on Sept. 10. But Rumania and Yugoslavia refused to sign because by doing so they would have pledged themselves to accept Minorities Treaties, similar in character and intention to that which Poland had signed at Versailles on June 28, under the terms of the German treaty. The argument which the principal Powers stated in defence of the Minorities Treaties was forcibly put by Mr. Wilson at the eighth plenary session (May 31). These Powers could not be expected to guarantee the independence and integrity of the new states, unless the latter would on their side guarantee equality of rights to the minorities, racial or religious, which, under the terms of the peace settlement, were being transferred from the allegiance of ex-enemy Governments. But this argument did not fit the case of Rumania or of Yugoslavia so completely as that of Poland or of Czechoslovakia. Rumania and Yugoslavia were old states, and (though greatly enlarged by the peace settlement) denied the right of the Conference to limit their sovereignty by special stipulations. They might have accepted minority treaties applying exclusively to new territories acquired under the peace settlement; but the Minorities Treaties presented for their signature applied indifferently to old and new territories alike. Eventually they were obliged to give way; but they did not sign the Austrian treaty and the Minorities Treaties until Dec. 10 1919, after receiving an ultimatum from the Conference. The final ratification of the Austrian treaty took place on July 16 1920.

Summary of Austrian Treaty.—The new Austria includes the provinces of N. Tirol and Vorarlberg, Salzburg, Carinthia, Styria (N. of the Drave), a strip of western Hungary and Upper and Lower Austria. The treaty reserves for future determination considerable sectors of the frontier on the E. and S.E., but the Klagenfurt plebiscite has settled the most important of the doubtful points in Austria's favour. Unlike Germany, Austria has been obliged to give explicit guarantees of the rights of her minorities; these guarantees may, however, be modified with the assent of a majority of the Council of the League of Nations (Arts. 62-9). Under the military clauses the Austrian army may not exceed a total of 30,000 officers and men, and is to be constituted and recruited by voluntary enlistment (Arts. 119, 120). Stocks of guns, munitions and equipment are restricted as in the German treaty, and surplus stocks are to be surrendered, and no air forces may be maintained. A special section of the Reparations Commission is constituted to assess and to collect the payments due from Austria (Art. 179); it is to include representatives of the United States, Great Britain, France, Italy, Greece, Poland, Rumania, Yugoslavia and Czechoslovakia; but the four first named Powers have two votes apiece,

and thus constitute a majority. Besides the "reasonable sum" to be paid before May 1 1921 (Art. 181), Austria is required to hand over all merchant ships and fishing-boats owned by nationals of the former Austrian Monarchy, and up to 20% of her river fleet; also animals, machinery and equipment, up to the limits of her capacity, for the restoration of devastated territories. Immediate delivery is required of specified quantities of live stock for Serbia, Rumania and Italy. Austria is made liable for so much of the Austrian war debt as is held outside the boundaries of the Austro-Hungarian Monarchy; but she is not liable for war debt bonds which are held by other states, or by their nationals, within those boundaries (Art. 205). All transferred territories of the monarchy are to be liable for their fair share of the pre-war Austrian debt (Art. 203). Austria renounces all claims to the state property, including royal property, lying within the transferred territories; but the states acquiring such property will be debited, and Austria will be credited, with its value by the Reparations Commission (Art. 208). The commercial clauses are similar to those of the German treaty. In the clauses relating to ports, railways and rivers, it is provided that the old Danube commission shall be revived, and that the Upper Danube (from Ulm downwards) shall be controlled by a new commission on which Great Britain, France, Italy, Rumania and the riparian states will be represented (Arts. 301, 302). Austria is guaranteed free access by railway to the Adriatic through the territories and the ports which have been severed from the monarchy (Art. 311).

The Austrian treaty is supplemented by two special agreements which were signed at St. Germain-en-Laye on Sept. 10 1919. By the first of these Poland, Rumania, Yugoslavia and Czechoslovakia agree with the other Allied and Associated Powers to make separate payments, not exceeding in the aggregate 1,500,000,000 gold francs, as a contribution to the costs of liberating the territories which have been transferred to them from the monarchy. By the second Italy agrees to make a similar payment, in consideration of the provinces assigned to her. None of these payments was to be made before 1926.

The Bulgarian Treaty, Nov. 24 1919.—The Bulgarian delegates, headed by M. Theodoroff, the Prime Minister, arrived in Paris on July 26, but did not receive the draft treaty until Sept. 19. The terms were not altogether unexpected, for M. Theodoroff had lodged objections against some of them on Sept. 2. But five weeks elapsed before the formal observations of the delegates were presented to the Supreme Council (Oct. 24). The Bulgarians demurred to the terms of the territorial settlement, which were thought by critics on the side of the Allies to be too lenient; they also complained that Bulgaria was harshly treated in not being immediately admitted to the League of Nations. They protested that Bulgaria could not afford to abolish conscription and maintain an army of volunteers, even on the small scale prescribed by the draft treaty. The Supreme Council in their reply (Nov. 3) promised speedy admission to the League, but made no other concession of substance. Further remonstrances from the Bulgarians merely led M. Clemenceau to intimate (Nov. 5) that the treaty as it stood must be either accepted or rejected within ten days. By this time M. Theodoroff had resigned office. His party had been severely defeated at a general election held in Aug., and he shrank from the invidious responsibility of signing the treaty. A new Government was formed by the leader of the Agrarian party, M. Stambolisky; and, on Nov. 13, Bulgaria's acceptance of the inevitable was notified to the Supreme Council. The treaty was signed at Neuilly-sur-Seine on Nov. 27, M. Stambolisky acting as the sole signatory for Bulgaria.

The general principle of the territorial terms is to restore the frontiers of 1914; but Bulgaria cedes to the principal Powers the share of Thrace which had been left to her by the Treaty of Bucharest; the Powers undertake to provide (by arrangement with Greece) outlets for Bulgarian trade on the Aegean. Certain districts are transferred (for strategic reasons) from Bulgaria to Yugoslavia; the most important of these districts contains the town of Strumitza. It is stated that further transferences of

territory to Yugoslavia were considered at the Conference, but were rejected on ethnological grounds as they would have affected districts in which the Bulgarian nationality preponderates. The reparation terms are more definite than those of the German and Austrian treaties. Bulgaria is required to pay 2,250,000,000 gold francs by half-yearly instalments extending over a period of 37 years. An inter-Allied commission of three members (representing France, Great Britain and Italy) will remain in Bulgaria to see that the reparation terms are duly honoured. This body will decide how the half-yearly payments are to be raised. It will prepare a list of the taxes and other revenues which are to be appropriated to reparation. If Bulgaria makes default in respect of any instalment, the commission may assume the duty of collecting the appropriated revenues. The commission may also recommend the Central Reparations Commission to give a time of grace for any particular instalment, or to reduce Bulgaria's liability. Such a recommendation will take effect if it is endorsed by a majority of the Reparations Commission. Bulgaria must provide, by way of restitution, specified quantities of live stock for the devastated areas in Greece, Rumania and Yugoslavia. She must also supply Yugoslavia with 50,000 tons of coal annually for five years. The maximum size of the Bulgarian army is fixed at 20,000 officers and men, raised by voluntary enlistment; but Bulgaria may maintain gendarmes, customs officials, forest guards and some other kinds of police and frontier guards (all armed with rifles) up to the number of 13,000. All Bulgarian war-vessels (including submarines) are to be surrendered or broken up, except four torpedo-boats and six motor-boats. No air forces may be maintained, no submarines may be built or otherwise acquired. The importation of arms and munitions is prohibited; only one munitions factory is permitted. No new fortifications may be constructed in Bulgaria.

The Hungarian Treaty, June 4 1920.—The Hungarian delegates did not appear in Paris until Jan. 7 1920, and over six months elapsed before the Treaty of Trianon was signed. But the main features of this treaty had been settled long before the Peace Conference dissolved. Except in the territorial terms it was closely parallel to the Austrian treaty. The Supreme Council had informed Bela Kun on June 13 1919 what territories would be transferred to Czechoslovakia and Rumania; and on July 20 1919 the German districts of western Hungary were promised to Austria. But some time elapsed before Hungary acquired a Government which commanded the confidence of the Allies. Late in July 1919 Bela Kun was overthrown by the Rumanians, whom he had attacked on the line of the river Theiss. The Rumanians then occupied Budapest, and permitted the Archduke Joseph to assume the title of Administrator, with the support of a number of ex-officers (Aug. 6). The Archduke applied to the Supreme Council for recognition; but the Council insisted that he should resign, and that steps should be taken to form a coalition Government (Aug. 22). The Archduke then effaced himself, but his Premier, M. Friedrich, remained in office until the Rumanians evacuated Budapest in November. At last on Nov. 24 a coalition Government was formed under M. Huszar, and M. Friedrich joined the new Cabinet as Minister for War. M. Huszar was promptly recognized by the Supreme Council (Dec. 1), in spite of the fact that the strength of his position had not yet been tested by a general election. This, however, took place early in 1920 and produced a National Assembly whose sentiments were comparatively reasonable. The draft treaty was handed to the Hungarian delegates on Jan. 15 1920, a week before the termination of the Conference; the negotiations were left to be conducted by the Council of Ambassadors. On Feb. 12 the Hungarians presented counter-proposals and observations which were the reverse of conciliatory. They argued that the position of the Magyars in Hungary was an exact parallel to that of the Czechoslovaks in Bohemia, and asked why the principle of self-determination had been differently applied to the two cases. They asked that the Szeklers of E. Transylvania should be left under Hungarian rule; that all the territories which Hungary was required to

surrender should remain within the Hungarian customs régime for a period of years; that no territories should be transferred without a plebiscite, or, alternatively, that better safeguards should be provided for the rights of Magyar minorities. These requests came too late for serious consideration. All the ambassadors would promise was that the League of Nations should be free to consider any minor rectifications of boundaries which the frontier commissions might recommend on ethnological or economic grounds. It is remarkable that this reply, which only involved small alterations in the draft treaty, was not transmitted until May 6. There was one Hungarian pretension with which the Allies dealt more promptly. The Huszar Government claimed that Hungary was still a monarchy, though the royal dignity was in suspense; it was no secret that many Hungarians still desired a Habsburg dynasty. But on Feb. 2 1920 Great Britain, France and Italy declared that a Habsburg restoration in Hungary would violate the fundamental principles of the peace settlement. The Hungarian royalists did not even then abandon all hope; the monarchical character of the constitution was reaffirmed by the Government on March 23. But since the signature of the Treaty of the Trianon the three states of Czechoslovakia, Yugoslavia and Rumania have combined in a "Little Entente" which avowedly exists to defeat any Hungarian project for a Habsburg restoration.

The only parts of the Hungarian treaty which call for comment are those which fix the future boundaries of Hungary and the allocation of the transferred provinces. On the N. the new frontier gives to Czechoslovakia the southern slopes of the Carpathians, mainly though not entirely populated by Slovaks. To provide Czechoslovakia with a frontage on the Danube and to secure the economic unity of the Carpathian territories, the frontier line has been so drawn as to place large Magyar populations under Czechoslovak rule. Similarly Rumania receives not only Transylvania, in the E. of which there is a compact Magyar (Szekler) minority, but also a broad strip of the Hungarian plain to the W., in which the chief towns are Magyar, in order that Transylvania's railway communications with the Danube may be adequately secured. The Banat, which is divided between Rumania and Yugoslavia, has a mixed population, predominantly Slav in the western and predominantly Rumanian in the eastern half of the province. The German element in the eastern Banat is considerable and would no doubt have preferred to remain under Hungarian rule. But the chief difficulty which the Conference experienced in dealing with the Banat was the adjustment of the conflicting claims of Yugoslavia and Rumania. For the Allies, in their secret treaty of Aug. 1916 with Rumania, had promised her the whole of the Banat, without regard to the historic claims of Serbia. At the Conference M. Bratianu pressed for the fulfilment of the secret treaty. He was met with the reply that Rumania herself had cancelled it by making peace with the Central Powers in May 1918; but he continued to reiterate his demands until the terms of the partition of the Banat were irrevocably settled by the Conference and announced to the world (June 13 1919). To this incident were due the Rumanian occupation of Budapest, the intrigue with the Archduke Joseph (which seems to have included a plan for the union of the Rumanian and Hungarian crowns) and the delay of Rumania in signing her Minorities Treaty.

Like Austria, Hungary is precluded from alienating her independence, except with the consent of the Council of the League of Nations (Art. 73). She is required to pay a reasonable sum, fixed by the Reparations Commission, before May 1 1921; her total liability will be fixed by the same body (Arts. 163, 165) and the balance is to be paid in half-yearly instalments over a period of 30 years, unless payment is respite or remitted by the Allies. She is to surrender all her merchant shipping, up to 20% of her river fleet, and an indefinite quantity of live stock (at the discretion of the Reparations Commission) for devastated countries.

The Adriatic Question.—When the Italian plenipotentiaries appeared at Paris in May 1919 they were offered by the

American delegation the so-called Tardieu Compromise, under which Fiume and its hinterland would have constituted an independent state for 15 years, and a plebiscite would afterwards have been taken to ascertain the views of the inhabitants. To this compromise, it is alleged, Sig. Orlando gave his consent; but the Yugoslav delegates insisted on unacceptable amendments, and the American attempt at mediation was dropped at that time. Subsequently the Italian poet D'Annunzio, at the head of a band of volunteers, occupied Fiume (Sept. 12) while fresh negotiations were in progress (at Washington) between Mr. Wilson and the Italian Government. In spite of this *coup d'état*, which was disavowed by Italy, the American negotiations continued; by Oct. 27 Italy had agreed that Fiume should be a free state under the protection of the League of Nations and had resigned her claims on Dalmatia, while Mr. Wilson was prepared to recognize Italy's sovereignty over the Pelagosa group, Lissa, Lussin, Unie and the port of Valona. The Adriatic position was then examined more minutely at Paris by M. Clemenceau, Sir Eyre Crowe and Mr. Polk. These three proposed that Italy should be offered a protectorate over the Dalmatian city of Zara, but that she should be asked to abandon her demands upon the isle of Lagosta and the eastern part of Istria, and also her proposal that the city of Fiume should be made independent of the free state of Fiume. The offer did not satisfy Sig. Nitti, who intimated that Italy, in default of a more acceptable scheme for a compromise, would take her stand on the secret Treaty of London. To this Mr. Lloyd George and M. Clemenceau replied that they too were willing in the last resort to abide by that treaty, but on Jan. 14 1920 they offered new terms which were distinctly more favourable to Italy than those of Dec. 9 1919. The new terms were drafted after Mr. Polk had left Paris for Washington, and were presented to Sig. Nitti before the U.S. Government had been consulted regarding them. Accordingly Mr. Lansing intimated, on Jan. 20, that Mr. Wilson could not admit the right of France and England to modify, on their own responsibility, the only terms of compromise to which an American representative had subscribed. The French and British Prime Ministers argued, in reply, that their new proposals were actually more favourable to Yugoslavia than those of Dec. 9, and were intended to save France and England from the necessity of honouring the Treaty of London, to which, as was notorious, Mr. Wilson had always objected. But on Feb. 10 Mr. Wilson stated precisely his objections to the terms of Jan. 14. They gave to Italy the whole of Istria and the prospect of a future protectorate over Fiume. They also provided for the partition of Albania between Yugoslavia, Italy and Greece. Mr. Wilson stated that he could not coöperate with the European Allies if they allowed the admitted principles of justice to be overborne "by the country possessing most endurance in pressing its demands." The upshot of the controversy was that Italy and Yugoslavia were left to settle their differences, if they could, by separate negotiations, with the proviso that they must not come to terms at the expense of Albania. It took some time to reach this consummation. But on Nov. 12 1920 Italy and Yugoslavia concluded the Treaty of Rapallo, and on Jan. 2 1921 D'Annunzio's garrison at Fiume surrendered to the Italian Government. Albania, thanks to Mr. Wilson's intervention, has established an independent Government and has been admitted (Dec. 17 1920) as a member of the League of Nations. The Adriatic question was thus provisionally settled, nearly a year after the close of the Conference, but still on lines which the Conference had suggested.

The Turkish Treaty.—The Turkish question was discussed at Paris in May and June 1919, but the drafting of the Turkish treaty was not seriously taken in hand until the London Conference of Feb. 1920. This delay was due partly to the hope (unhappily falsified) that the United States would join in the treaty; but also to difficulties arising out of the allocation of mandates for the non-Turkish portions of the Ottoman Empire. The twelfth of the Fourteen Points provided that these territories should receive "unmolested opportunity of autonomous development." Article 22 of the Treaty of Versailles indicated

that some at least of them would be recognized as independent nations, under such mandates as they were willing to accept. The principal claimants for these mandates were France and Great Britain, who in May 1916 had come to an understanding about their future spheres of influence (the Sykes-Picot agreement), on the basis that the French sphere should include Cilicia, Southern Armenia and Syria (with autonomy under French protection for Damascus, Aleppo, 'Urfa, Deir and Mosul); that Palestine should be an international territory; and that Haifa and Mesopotamia should be in the British sphere. But Greece claimed the whole of Turkish Thrace, Smyrna (which she occupied with the approval of the Supreme Council in May 1919) and the Aegean Is.; while Italy claimed the Dodecanese (of which she had retained possession at the end of the Libyan war in 1912) and a sphere of influence on the adjacent mainland. There were difficulties connected with all these claims. The most notorious conflict of interests was that between France and the Hejaz (over the Arab districts of Syria), which came to a head in March 1920 with the proclamation by a "Syrian National Congress" of an independent Syria (to include the Lebanon, Palestine and Mesopotamia) and of Faisal, the heir apparent of the Hejaz, as the king of this state; but there were also doubts as to the wisdom of allowing Greece to assume responsibility for Smyrna, and as to the possibility of reconciling the French and Italian claims with Mr. Wilson's promise to respect the political unity of the Turkish race. The future of Constantinople was long in doubt. At last on Feb. 16 1920 the Conference of London announced that it would remain the Turkish capital; but, a month later, the Allies informed the Turkish Nationalists that this concession was conditional on their good behaviour, and Constantinople was temporarily occupied by Allied troops under the command of Gen. Milne. On April 24 the Conference of San Remo gave mandates to France for Syria, Cilicia and the Lebanon; to Great Britain for Palestine and Mesopotamia; a mandate for Armenia was declined first by the League of Nations (April 27) and afterwards by the United States Senate (May 27). At last on May 11 the draft treaty was handed to the Turkish delegates at Sèvres. Its terms produced considerable excitement among the Nationalists, and it was necessary for the Allies to call upon the Greeks to make armed demonstrations both in Asia Minor and in Thrace. But at the Conference of Spa (July) the last touches were put to the treaty and on Aug. 10 it was duly signed by the Turkish delegates.

Under the treaty Constantinople is left to the Sultan, with the proviso that it may be forfeited if Turkey violates the terms of settlement, especially those by which she guarantees the rights of minorities in her territory. In accordance with the Fourteen Points the Straits are neutralized and placed under the control of an international commission. Smyrna, with about half its *vilayet*, is left under Turkish sovereignty, but this sovereignty will be exercised by the Greek Government, and Smyrna may be incorporated in the Greek customs area. There is to be a local legislature, which may, if it so desires, petition the League of Nations (within five years) for the incorporation of Smyrna in the Greek kingdom. Greece also receives, in full sovereignty, Thrace outside the zone of the Straits, Imbros, Tenedos, Lemnos, Samothrace, Mytilene, Chios, Samos and Nikaria. But she may not fortify the first five of these islands (owing to their proximity to the Straits); and she engages to sign a minorities treaty. Armenia is declared a free and independent state; the boundary between Turkey and Armenia is to be referred to the arbitration of the President of the United States. Syria, Mesopotamia and Palestine are recognized as independent states; their boundaries will be fixed by the principal Powers, and they are to be administered by mandates, on terms formulated by the principal Powers and submitted to the Council of the League of Nations for approval. The Hejaz is recognized as a free and independent state. Turkey cedes to Italy the islands of Astropalia, Casso, Scarpanto, Rhodes, the Dodecanese and Castellorizo. The British protectorate over Egypt and the British annexation of Cyprus are confirmed. The chief feature of the

military clauses is the proviso that Turkey may maintain no military forces except the Sultan's bodyguard, and gendarmes and frontier guards not exceeding 50,000 in number. The Allies waive their claims for reparation. But Turkey is to pay the costs of the armies of occupation since the Armistice of Oct. 30 1918, and to compensate civilian nationals of the Allies for loss or damage suffered in the war through the action or negligence of the Turkish authorities.

BIBLIOGRAPHY.—All the treaties have been published by the Stationery Office. Supplementary documents are printed in the *History of the Peace Conference*, vols. i.-iii., ed. H. W. V. Temperley (1920-1), which also comments exhaustively on the German treaty, and gives an account of proceedings up to June 28 1919. Three more volumes are in preparation; these will deal with the remaining treaties. A few more documents will be found in the *American Journal of International Law* (and supplements) for 1919 and 1920. The German *Comments on the Conditions of Peace* of May 29 1919 is published (in English) by the Amer. Assoc. for International Conciliation (Oct. 1919); the *Reply of the Allied and Associated Powers*, of June 16 1919, is published by the Stationery Office: Cmd. 258 (1919). For the question of Fiume see documents published by "Adriaticus" in *La Question Adriatique* (1920), and the Stationery Office paper: *Correspondence relating to the Adriatic Question*, Cmd. 386 (1920). Of books describing or criticising the Conference the following are useful: Sir M. Hankey, "Diplomacy by Conference" (*Proc. Brit. Inst. of International Affairs*, 1921); H. Wilson Harris, *The Peace in the Making* (1920); J. M. Keynes, *Economic Consequences of the Peace* (1919); C. H. Thompson, *The Peace Conference Day by Day* (1920). Of capital importance is the series of articles by M. André Tardieu in *L'Illustration* for 1920, reprinted in his book *La Paix* (1921). See also R. Lansing, *The Peace Negotiations* (1921) and *The Big Four and Others* (1921). (H. W. C. D.)

PEARCE, CHARLES SPRAGUE (1851-1914), American painter (see 21.24), died in Paris, France, May 18 1914.

PEARS, SIR EDWIN (1835-1919), British lawyer and man of letters, was born at York March 18 1835, and educated privately and at the London University where he took first-class honours in Roman law and jurisprudence. He was called to the bar at Middle Temple in 1870 and for a time was private secretary to Frederick Temple, afterwards archbishop of Canterbury, and secretary to various associations connected with social work in London. In 1873 he settled in Constantinople, practising in the consular courts and becoming president of the European bar there. He acquired in this way an intimate knowledge of the East which he turned to account in 1876 when, as correspondent of *The Daily News*, he sent letters home describing Moslem atrocities in Bulgaria which aroused popular demonstrations in England led by W. E. Gladstone (see 12.71). He was knighted in 1909. His works include *The Fall of Constantinople, a Story of the Fourth Crusade* (1885); *The Destruction of the Greek Empire* (1903) and, his most distinguished book, *Turkey and its People* (1911) in which he displayed his expert knowledge of Byzantine Constantinople. He died Nov. 27 1919 at Malta as the result of an accident on his journey home from Constantinople.

PEARSE, PATRICK HENRY (1879-1916), Irish educationist, author, and Sinn Féin leader, was born in Dublin on Nov. 10 1879. His father was an Englishman, a sculptor and worker in stone, who was himself the author of a pamphlet on *England's Duty to Ireland as it appears to an Englishman*. It is likely that it was from his father Pearse derived his love of liberty; and from his mother, whose people came from county Meath, he drank in memories of '98 and of the Fenians. He was educated at the Christian Brothers schools and graduated before he was 24 at the Royal University of Ireland as a B.A. and B.L. His first serious work was when he became editor of the *Claidheamh Soluis*, the weekly organ of the Gaelic League. When engaged on this work he made a tour through Belgium to study bilingual methods, and edited several *Fiana* tales from Irish manuscripts. He was a hard worker on the *Coisde Gnotha* or Executive of the League, and secretary to its publication committee. He was more interested in education than in any other subject, and it is remarkable that he was in favour of accepting Mr. Birrell's Irish Code bill (see 14.788) in 1907, because it gave the Irish control over their own education. In this attitude he stood almost alone. His first book was a slender volume containing *Three L*

celic Topics, published when he was only 19, dedicated to the New Ireland Literary Society (an ephemeral body which he himself had founded) by its President. This little book contained the germs of much later and better work, including a plea for enthusiasm, and a prophecy that the Gael would "become theaviour of idealism in modern intellectual and social life." In order to carry out his educational schemes he founded a school

Cullenswood, in Dublin, which prospered. The idea was to give an Irish education such as he assumed would be given in a free Ireland. Much stress was laid on the Irish language and on religion. In 1910 he removed this school to the Hermitage, Rathfrilandham, a few miles out of Dublin, and continued to run it until his death. He travelled in America collecting money for his schemes, and on his return threw himself into the Irish Volunteer movement. He was high up in its councils, and led in the revolution of 1916, of which he was commander-in-chief. At the same time he proclaimed an Irish Republic. After a week's fighting in Dublin he saw that further resistance was useless, and ordered the Volunteers to lay down their arms. He and Thomas MacDonagh, who had formerly been one of his assistant masters at the Hermitage, and other leaders were tried by court-martial and shot soon after their surrender. Pearse was an excellent orator, with a fine resonant voice. He was a pious Catholic, of approachable life, a great lover of children and of nature.

After his death appeared *The Collected Works of Padraic H. Pearse* (3 vols. 1917), containing plays, poems and stories in Irish, and one volume of English writing. (D. Hy.)

PEARSON, SIR (CYRIL) ARTHUR (1866-1921), English newspaper proprietor and philanthropist, was born at Wokeley, 11 Wells, Feb. 24 1866, and was educated at Winchester. He founded the business of C. Arthur Pearson, Ltd., newspaper proprietors and publishers; and after having made large profits with *Pearson's Weekly* and other periodicals he founded in 1900 the *Daily Express*, a halfpenny rival to the *Daily Mail*, and in 1904 purchased the *Standard* (see 19.560, 561). He was a long supporter of Mr. Chamberlain's tariff-reform movement.

His increasing—later complete—failure of sight obliged him to retire from the active direction of newspapers. Henceforth he devoted himself and his fortune with whole-hearted lustre to efforts to ameliorate the condition of the blind. During the World War he established at his house, St. Dunstons, in Regent's Park, London, a hospital for blinded soldiers, and became chairman of the Blinded Soldiers and Sailors Care Committee (1914). He also became president of the National Institution for the Blind. He was created a baronet in 1916 and G.B.E. in the first gazette of the new Order of the British Empire in 1917. He died in London Dec. 9 1921. Having been eager to encourage those among the blind who cannot command tendance, he had made it his practice to have his bath undisturbed, but on this occasion he accidentally slipped, was stunned by striking his head on a tap and suffocated while unconscious, his face under water.

PEARY, ROBERT EDWIN (1856-1920), American Arctic explorer (see 21.30), died in Washington, D.C., Feb. 20 1920. Because of his discovery of the North Pole (1909) he was promoted rear-admiral in 1911 and received by special Act the thanks of Congress. The same year he was U.S. delegate to the International Polar Commission in Rome. During his later years he was much interested in aerial navigation and delivered many lectures in which he urged coast patrol by aeroplanes. In 1913 he was made Grand Officer of the Legion of Honour (France). He was the author of *The North Pole* (1910) and *Secrets of the North Pole* (1917).

PEEL, ARTHUR WELLESLEY PEEL, 1ST VISCOUNT (1829-1922), English statesman (see 21.30), died at Sandy, Beds., Oct. 24 1922.

He was succeeded by his son, WILLIAM ROBERT WELLESLEY PEEL, who in 1916 was chairman of the Committee on Detention of Neutral Vessels, in 1919 became Under-Secretary for War, and in 1921 Chancellor of the Duchy of Lancaster.

PEKING, China (see 21.61).—During the first decade of the Chinese Republic, great improvements were made in the

matter of the maintenance, lighting and sanitation of the principal thoroughfares of the capital; the police were reorganized on western lines, and instructed in traffic control; and, as the result of the introduction of metalled roads, the old-type mule cart was rapidly replaced by carriages, motor-cars and jinrikishas. Many of these changes were due to the initiative of Chu Chi-chien, Minister of the Interior in 1913.

The conditions of railway traffic between the city and the outside world were also greatly improved by the location of the termini of the Peking-Moukden and Peking-Hankow lines at the Chien Men, the great southern gate of the Tatar city, which lies between the palace and the Temple of Heaven. The wall adjoining this gate has been pierced with new passages for general traffic and broad thoroughfares thrown open to the public in the Forbidden City.

A large number of buildings in foreign style have been erected for Government offices, banks and business premises. In spite of these changes, however, chiefly conspicuous in the official and business quarters in the vicinity of the legations, the general features of the scene which the traveller sees from the walls remain much the same as in former times, a vast enclosure within which the yellow-tiled roofs of palaces and temples emerge here and there above the trees; and in the less frequented parts of the city, notably the Manchu quarter, there is but little outward evidence of change. The poverty-stricken appearance which the Chien Men district and other business centres presented as the result of the destruction wrought by the Boxers in 1900 has gradually disappeared.

The trade of the city remains local as of old, and generally unconcerned with industrial enterprise, but during the first ten years of the Republic the citizens of the capital were able to recover a considerable measure of comfortable prosperity, because of the freedom with which money was circulated by the various political and military parties.

New macadamized roads running from the city in several directions (to the western hills, to Tongshan and to Tungchow) are amongst the most conspicuous manifestations of the Peking municipal council's activities. The number of foreigners resident at the capital has increased considerably in recent years, and, although the city has not been opened by treaty to foreign trade, a number of business houses have been established with the tacit consent of the Chinese authorities.

See E. Backhouse and J. O. P. Bland, *Annals and Memoirs of the Court of Peking* (1913); D. Mennie and P. Weale, *The Pagan of Peking* (1921); P. H. Kent, *The Passing of the Manchus* (1912); J. O. P. Bland, *China, Japan and Korea* (1921).

PÉLISSIER, HARRY GABRIEL (1874-1913), English comedian, was born at Finchley in 1874. His father was a Frenchman living in England—a descendant of Marshal Pélissier—and his mother was English. In 1911 he married Fay Compton, the daughter of Edward Compton, the actor. He became an "entertainer" and author of musical sketches and organized a troupe known as "The Follies," who gained a very great success in a special genre of musical entertainment, half song, half witty parody, at the Apollo theatre, London. He died in London Sept. 25 1913.

PELLETAN, CHARLES CAMILLE (1846-1915), French politician and journalist (see 21.69), died June 4 1915.

PENLEY, WILLIAM SYDNEY (1852-1912), English actor (see 21.99), died at St. Leonards-on-Sea Nov. 11 1912.

PENNSYLVANIA (see 21.105).—During 1910-20 there was a great increase in the industrial developments of Pennsylvania, largely as a result of the World War. From 1914 until American participation in 1917, the Allied Governments expended many millions of dollars among the steel, ammunition and other establishments, bringing to the state a period of prosperity the extent of which was apparent when the Liberty Loans and war taxes disclosed the accumulated wealth. The state maintained its rank as the second state in population and in industry.

The pop. of the state in 1920 was 8,720,017, an increase of 1,054,906 over 1910. The rate of increase, 13.8%, was considerably lower than that of the preceding decade, 21.6%. In 1920 the pop. of the 15 largest cities of the state was: Philadelphia, 1,823,158; Pittsburgh, 588,193; Scranton, 137,783; Reading, 107,784; Erie, 93,372; Harrisburg, 75,917; Wilkes-Barre, 73,833; Allentown, 73,502; Johnstown, 67,327; Altoona, 60,331; Chester, 58,030; Lancaster, 53,150; Bethlehem, 50,358; York, 47,512; and McKeesport, 46,781.

Agriculture.—A decrease of nearly \$100,000,000 in the value of crops from 1919 to 1920 was reported by the state department of agriculture, but the state's farms showed an improvement in

PENNSYLVANIA

41

production during the preceding decade. The contrast is shown in the following table:—

	1909	1920
Wheat	26,265,000 bus.	26,774,760 bus.
Indian Corn	48,800,000 "	65,755,660 "
Oats	25,948,000 "	44,858,325 "
Buckwheat	5,665,000 "	4,952,860 "

The depreciation in the value of crops from 1919 to 1920 was due in part to reduced acreage, but chiefly to the heavy decline in prices. The average farmer in 1920 lost \$434.20 as a result of depreciation. The price of the average dairy cow during the year dropped from \$96.75 to \$75.50, the dairy industry alone depreciating \$20,890,774. Sheep depreciated \$3.75 a head, falling from \$10.25 to \$6.50, and the total loss to sheep-raisers was \$4,000,000. Hogs declined from \$30.90 to \$16.15 and farm horses from \$111 to \$102. The potato production for the entire state for 1920 was 29,158,435 bushels. The state department of agriculture valued the total fruit production of 1920 (20,825,000 bus.) at \$18,742,500.

Mineral Production.—The following table shows the figures of the coal and coke industry during 1910-8, in tons:—

	Bituminous	Anthracite	Coke
1910	148,770,858	83,683,994	23,722,944
1911	142,189,329	90,917,176	19,984,320
1912	160,830,492	84,426,869	24,682,474
1913	172,965,659	91,626,964	24,718,238
1914	145,884,530	91,189,641	17,164,124
1915	157,420,068	89,377,706	22,012,945
1916	169,123,814	87,680,198	26,428,926
1917	171,074,411	100,445,299	23,240,777
1918	177,217,294	99,445,794	27,157,373

During these years an average of 190,000 persons were engaged in mining bituminous coal and 170,000 in mining anthracite.

Manufactures.—In the absence of final industrial figures for the U.S. census of 1920, not yet available in Dec. 1921, comparisons between the industries of 1909, 1914 and 1919 must be drawn from U.S. census figures for the first two periods and the survey made by the state department of internal affairs for the latter. In 1914 Pennsylvania became the foremost state in the value of silk production, displacing New Jersey. Her 1914 production was valued at more than one-third of the total for the United States, and the state had more than two-fifths of all the employees in the industry. In 1909 226 silk-producing establishments, with 36,469 employees, had a production valued at \$62,061,000. In 1914 284 establishments, with an average of 44,755 wage-earners, produced material valued at \$86,938,554. In 1919 347 establishments, with 57,079 employees, produced material valued at \$238,422,600. Pennsylvania was the leading state in 1914 in hosiery manufacture, reporting 39.7% of the national quantity and 41.2% of the national value. In 1909 464 establishments manufacturing hosiery, employing 38,206 hands, produced a value of \$49,658,000; in 1914 498 establishments, with 41,130 employees, produced a value of \$64,163,449; in 1919 328 establishments, with 35,400 employees, \$130,167,800. In the iron and steel industry in 1909 66 blast furnaces, with 14,521 employees, yielded \$168,578,000, and in 1914, 52 with 11,518 employees a product valued at \$135,806,067. Notwithstanding the decrease the state in 1914 employed 39.2% of all the wage-earners and produced 42.8% of the total product of the country. Steel works and rolling mills in 1914 also showed a decrease from 1909. In 1909 189 establishments, with 126,911 employees, produced \$500,344,000, and in 1914 178 establishments, with 131,955 employees, produced \$488,106,324. In the manufacture of tin-plate, Pennsylvania in 1914 led the nation. Comparative figures show:—

	Establishments	Employees	Product
1909	17	2,346	\$ 25,234,066
1914	13	2,368	36,795,990
1919	8	12,311	115,642,300

The state census of 1919, for all industries, shows a total of 20,888 establishments in the state divided as follows:—buildings and contracting, 2,895; chemicals and allied products, 768; clay, glass and stone, 583; clothing, 1,398; food and kindred products, 2,404; leather and rubber goods, 395; liquors and beverages, 453; lumber and its remanufacture, 1,114; paper and printing, 1,740; textiles, 1,024; laundries, 273; metals and metal products, 3,432; mines and quarries, 1,564; public service, 1,005; tobacco and its products, 709; and miscellaneous, 1,131. The total average number of employees was 1,691,171 (167,562 salaried employees, 1,523,609 wage-earners); the total wages, \$2,176,449,100, and the total value of products, \$8,853,047,600. The highest valuation was placed on metals and metal products, \$3,675,971,500, more than 40% of the whole value of production. Employees in this industry numbered 508,311. Next was a product of \$722,515,300 from the mining industries, which employed on an average 329,179 men in 1919. The textile industry maintained third place with 125,291 employees and a production valuation of \$646,683,000. The figures from 1915-9 are as shown in the following table.

	Establishments	Average No. Wage-Earners	Value of Production
1915	22,359	1,503,188	\$4,180,790,500
1916	20,961	1,735,543	6,419,410,000
1917	22,101	1,802,813	8,336,984,800
1918	21,158	1,827,101	9,403,306,600
1919	20,888	1,523,609	8,853,047,600

Education.—Two progressive steps a decade apart mark the development of the public schools. The first was the adoption of the School Code of May 18 1911; the second the enactment of what is known as the Finegan programme (named after the State Superintendent of Public Instruction) by the Legislature of 1921. The School Code of 1911 was virtually a codification of all the laws governing the public-school system and a general unification, with many new features, of administrative measures. Its most important sections provided for independent control of taxation and borrowing by school boards with minimum and maximum tax rates varying according to the size of the school district; reduction of the number of members in school boards so as to simplify official business; establishment of a State Board of Education; establishment of a state school fund, and general provisions for the better selection of text-books and for the development of higher education. The measures of 1921 (the Finegan programme) are as follows: (1) Providing that after Sept. 1 1927 those persons who enter the teaching service must show evidence of graduation from a state normal school or an equivalent education and training; (2) requiring fourth-class districts to maintain schools for 150 days in 1921-2 and 160 days in 1922-3; (3) increasing the qualifications of county superintendents by providing that no one except college-trained persons or normal-school graduates with certain school experience shall be qualified for the position; (4) increasing the salaries of all assistant county superintendents from \$1,800 to \$2,500 per year and giving most of the county superintendents an increase in salary of \$500 or \$1,000; (5) establishing a state-wide salary schedule for teachers, fixing the minimum at \$1,200. In cities annual increments are required, and proportionately higher salaries are provided for high-school teachers; (6) increasing the state aid to schools for each biennial period from \$24,000,000 to \$36,000,000 and establishing a new basis of apportionment; (7) encouraging consolidation by providing that for each school closed the district shall be entitled to receive an annual allotment of \$200; (8) making sufficient appropriations for normal schools so that they may be supported without tuition fees and providing a salary schedule for the faculties; (9) creating a State Council of Education to consist of nine business and professional men and women, replacing the State Board of Education and the college and university council; (10) standardizing the elementary courses in public and private schools and requiring that they be taught in the English language and from texts written in English; (11) strengthening the compulsory attendance laws.

Finance.—The revenues of the state more than doubled from 1909 to the end of 1920. The receipts in 1909 were \$28,945,210; in 1920, \$62,071,293.97. This does not include \$11,800,000 derived from the sale of state road bonds, a fund kept separate from the regular state moneys. Governor Sproul recommended to the 1921 session of the state Legislature an increase of about 10% in the tax on manufactures and a small tax on mined coal, a combination which would add more than \$30,000,000 to the treasury annually. The treasury disbursements in the fiscal year 1920 were \$74,960,112.20, the highest ever known. The total was \$18,000,000 higher than in 1919, the increase being due to road construction. During the 1920 season approximately 410 m. of concrete state road were built, and 350 m. were under construction in 1921. In two years, 660 m. of 18-ft. concrete roadway, some of which had a brick wearing surface and some asphalt, were constructed by the state. In 1920 a total of 337 m. of macadam highway were resurfaced and 1,400 m. of highway had surface treatment. The maintenance force of the State Highway Department in March 1921 was keeping up 9,503 m. of roadway, of which 463 m. were in boroughs and on state-aid roads. The total resources in 1919 of all the banking institutions within the state, whether organized under national or state laws, were \$4,529,919,000. Of these the state banks had resources in 1920 of \$3,615,244,850, divided as follows: savings banks, \$314,256,637; banks of deposit, \$331,759,257; trust companies: banking resources, \$1,380,919,028; trust funds, \$1,578,424,021; trust funds in banks, \$9,885,906.

Constitutional Changes.—The first two constitutional amendments of the decade ending 1920, adopted in 1911 and 1913 respectively, had to do with the courts, the one of 1911 increasing the number in Philadelphia county and merging those in Allegheny county, the one of 1913 altering the judicial and municipal terms to conform with an amendment of 1909 which changed the date of the elections from Feb. to November. Another amendment of 1913 enabled municipalities, except Philadelphia, to embark upon the construction or acquisition of waterworks, subways, etc., even though their debt brought the indebtedness above the limit allowed, and permitted arrangement whereby the interest and sinking-fund charges were from the principal until the properties should have been completed and in operation for one year. A limit of 10% of the assessed value of taxable property in a municipality was fixed for such

ness, three-fifths of the electors of the municipality having first to give their assent to the increase. On Nov. 2, 1915 the people voted on four proposed amendments and adopted three of them. The first and the most important prepared the way for workmen's compensation. The second enabled Philadelphia to increase its borrowing capacity under conditions similar to those set forth in the amendment of 1913. The third enabled the general assembly to enact laws providing a system of registering, transferring, insuring and guaranteeing land titles by the state or the counties. Amendments passed by the Legislature in 1915 and 1917 were approved by the voters in 1918, one enabling the state to issue bonds to the amount of \$50,000,000 for the improvement of highways, and the other enlarging Philadelphia's borrowing capacity by removing the previous restrictions which confined its increased indebtedness to the construction or acquisition of waterworks, subways, etc. An amendment approved at the general election in 1920 enabled the assembly to levy "graded or progressive taxes." The result of these numerous amendments was manifest in the session of 1919, when a bill was passed authorizing the governor to appoint a commission to study the constitution with an eye either to general revision or to amendment by sections. This commission held public hearings during 1920 and prepared a report to be placed before the session of 1921.

Legislation.—The number of boards, commissions, etc., functioning under the state government was greatly increased between 1919 and 1920. The Legislature in 1911 created a Bureau of Professional Education under the State Department of Public Instruction, its purpose being to regulate the education of physicians, dentists and pharmacists. The same year a State Board of Education was created, composed of six members, to report and recommend legislation needed to increase the efficiency and usefulness of the public-school system, to equalize educational advantages in all sections of the state, to inspect schools supported in part or in whole by the state, to encourage vocational training, to improve sanitary conditions and to promote physical and moral welfare. A Bureau of Medical Education and Licensure, under the Department of Public Instruction, was also created by Act of 1911, to examine into conditions in the medical schools and conduct the examination of students applying for state licenses. In 1911 the office of state fire marshal was created, with general powers of investigation over all fires in the state and means of fire prevention. Another important change of 1911 was the reorganization by legislative enactment of the State Highway Department and the undertaking of an extensive system of highways to be built and maintained entirely from state funds.

In 1913 the Department of Labor and Industry was created, with the power to enforce the "laws relating to the safety, health and prosperity of employees and the industries." Under it were formed the bureaus of Inspection, Hygiene and Engineering, Statistics and Information, Mediation and Arbitration, Employment, and also an Industrial Board. A Workmen's Compensation Board was created, the state was divided into districts and the administration of compensation carried on through referees and members of the board. A State Workmen's Insurance Board was created the same year for the purpose of administering the insurance fund provided in the Workmen's Compensation Act. In the meanwhile the Legislature in 1913 did away with the old State Railway Commission and substituted a Public Service Commission, with powers far greater than those of its predecessor, and having jurisdiction over "all railroad, canal, street railway, stage line, express, pipe line, ferry, common carriers," etc., companies "doing business within the state."

The year 1915 saw the reorganization of the Department of Agriculture with the creation of a Commission on Agriculture to appoint all officers and employees of the department and prepare the budgets of the department and of the State Live Stock Sanitary Board. Other new boards of that year were the one on vocational training under the Department of Public Instruction; the Board of Censors, upon all motion pictures; the Prison Labor Commission, to supervise the manufacturing industries of inmates of penal institutions; and the Veterinary Medical Examining Board. The Bureau of Municipalities under the Department of Labor and Industry was a development of 1917 intended to classify and make available statistics and other information tending to improve the government of municipalities. Five boards were created the same year: the State Military Board which has the power to grant pensions not exceeding \$12 per month to widows or minor children of national guardsmen killed on active duty while under the direction of the governor; the Board of Pharmacy; the Board of Optometrical Education, Examination and Licensure; the Board of Commissioners on Uniform State Laws and the Public School Employees' Retirement Board. The Legislature of 1917 also created a Commission on Public Safety and Defense, to which was appropriated \$2,000,000 and which functioned during the two years of American participation in the World War, partly independently and partly through the State Committee of Public Safety and Council of National Defense. The Commission on Public Safety and Defense was succeeded in 1919 by the Commission on Public Welfare, which received an appropriation of \$500,000 to carry on the work of reconstruction, Americanization, and collection of the records of the state's part in the World War. The session of 1919 also created a Bureau of Statistics and Information under the State Department of Internal Affairs, and red the Bureau of Municipalities from the Department of

Labor and Industry to the Department of Internal Affairs, and created a Bureau of Rehabilitation under the Department of Labor and Industry. The year 1919 witnessed the adoption of two Federal amendments, Pennsylvania ratifying the prohibition amendment, as the forty-fifth state, on Feb. 25, and the woman suffrage amendment, as the seventh state, on June 24.

More recent governors were John K. Tener, Republican, 1911-5; Martin G. Brumbaugh, Republican, 1915-9; William C. Sproul, Republican, 1919-.

War Period.—Pennsylvania sent 297,891 men into the U.S. army, of whom 53,419 were regulars, 21,350 national guardsmen, and 223,122 drafted. There were 31,063 Pennsylvanians in the navy, 16,872 of whom enlisted in the naval reserve, 13,772 in the regular navy, and 419 in the national naval volunteers. The state was represented by 5,422 men in the marine corps, making a total of 334,376 men and women in the national armed forces. In addition it had 1,600 Y.M.C.A. workers, 147 Knights of Columbus secretaries, and 129 welfare workers under the Society of Friends. In the army Pennsylvania suffered 35,042 casualties, of which 7,898 were deaths. Financially, 559,936 Pennsylvanians subscribed \$315,834,950 to the First Liberty Loan; 881,207 subscribed \$549,963,700 to the Second Loan; 2,026,973 subscribed \$467,758,550 to the Third Loan; 2,349,252 subscribed \$812,217,400 to the Fourth Loan; and 1,289,764 subscribed \$564,173,200 to the Victory Loan, making a total of \$2,709,947,800 for the five loans, a per capita of \$312.92 as compared with the per capita throughout the United States of \$232.31. The war taxes of the state were: 1917, \$589,056,143.20; 1918, \$446,811,191. The American Red Cross in its two campaigns in Pennsylvania raised \$27,283,090.00 or 10% of the total for the whole country. The Red Cross membership in the state at the close of 1918 was 1,669,758 adults and 1,451,057 juniors, the latter being 86-12% of the school population. Pennsylvania gave approximately \$3,000,000 to the war welfare work of the Knights of Columbus. The two Y.M.C.A. drives in the state netted \$6,562,516.23.

More than 85,000 men and women were employed in the six Pennsylvania shipyards on the Delaware river in 1918. The Hog I. plant near Philadelphia built 110 cargo vessels of 7,500 dead-weight tons apiece and 12 transports of 8,000 tons. The Harriman yard at Bristol, of the Merchants' Shipbuilding Corp., built 32 cargo vessels of 9,000 tons apiece; William Cramp & Sons at Philadelphia built four tankers of 10,000 tons apiece and nine steel ships, all but one of which were of more than 9,000 tons. Likewise it launched 35 destroyers during the war period and 13 subsequently. The Chester yard of the Merchants' Shipbuilding Corp. built 28 cargo ships and tankers averaging 8,000 tons apiece and several small naval vessels. The Sun Shipbuilding Co. at Chester built 14 ships averaging 11,000 tons apiece and four cargo ships of 10,000 tons apiece. It also constructed nine minesweepers for the navy. The yard for wooden ships of the Traylor plant at Cornwells Heights built eight vessels of 3,500 tons each. The Federal Government spent \$46,396,266.80 in housing war workers in the state, \$23,021,000 being spent by the Emergency Fleet Corp. for shipbuilders, and \$23,375,266.80 by the U.S. Housing Commission.

The Remington Arms Co. at Eddystone manufactured 1,181,908 rifles up to two days before the Armistice, or 47% of the American rifles supplied to troops at home and abroad. The Baldwin Locomotive Works at Philadelphia and Eddystone contracted for 470 steam locomotives for the U.S. Railroad Administration and nearly 4,000 steam locomotives for the A.E.F. and the Allies. The Aluminum Co. of America, at Pittsburgh, manufactured 3,385,955 meat cans for mess kits, or two-fifths of the total made in America. The Edward G. Budd Co., Philadelphia, pressed and stamped 1,150,775 steel helmets, while a total of 2,707,237 helmets were painted and assembled in the Ford Motor Co. plant in Philadelphia. The entire cannon-forging output of the country during the war was 8,440 before Armistice Day, and Pennsylvania's contribution was 2,960, or almost two-fifths. One of the three American powderbag loading plants was located at Tullytown, Pa.; it employed 7,000 persons and had reached a capacity of 40,000 bags a day at the date of the Armistice. The Pittsburgh Plate Glass Co. at Pittsburgh had a total output of 81,845 optical lenses when the end of the war caused a general cancellation of contracts. (A. E. McK.)

PENNSYLVANIA, UNIVERSITY OF (see 21.114).—In 1910 the Henry Phipps Institute for the study, treatment and preven-

tion of tuberculosis was transferred to the university. In 1912 the college was divided into three separate departments—the college, the Towne scientific school, and the Wharton school of finance and commerce. In 1914 the school of education was established, with a four-year course leading to the degree of Bachelor of Science in Education; since then there has been held every spring at the university "Schoolmen's week," and teachers from all over the state assemble to take part in conferences and discussions. By a merger in 1916 the Medico-Chirurgical College of Philadelphia became an integral part of the university as its graduate school of medicine, and in 1918 another merger was effected with the Philadelphia Polyclinic and College for Graduates in Medicine. In 1917 a course in military science was established to qualify students for commissions as reserve officers. In 1920 the laboratory of hygiene and public health became the school of hygiene and public health.

During the decade 1910-20 there were many developments in the widening of the university's usefulness to the community through the establishment of extension schools. In 1920-1 the university had 964 officers of instruction, of whom 302 were in the college, and 213 in the department of medicine. The enrolment was 11,182 students, including 2,652 women, of whom 753 were in the college (arts and science); 29 in biology; 780 in the college course for teachers; 1,281 in the summer school; 638 in the Towne scientific school; 2,277 in the Wharton school of finance and commerce; 1,439 in the evening school of accounts and finance; 996 in the extension schools; 700 in the school of education; 218 in the school of fine arts; 657 in the graduate school; 191 in the law school; 433 in the medical school; 101 in the graduate school of medicine; 735 in the school of dentistry; 30 in the school of veterinary medicine, and 6 in the school of hygiene and public health (duplications, 142).

Beginning with 1920 the tuition fees were raised from \$200 to \$250 in the college, the Towne school, the Wharton school, in education, law, dentistry, and hygiene; from \$200 to \$300 in medicine; and from \$100 to \$150 in veterinary medicine. In 1920-1 the income from tuition fees was \$1,425,000; the payment for "educational salaries" amounted to \$1,425,000, and for other salaries and wages \$678,000. In June 1920 the excess of the university's assets over its liabilities was \$26,000,000, and the donations for the year were \$278,000. The total value of real estate (including the university's buildings) was \$11,486,000; and libraries, museums, apparatus and furniture were valued at \$3,645,000. The university library, including numerous special collections, contained about 500,000 bound volumes and 50,000 pamphlets. A question of paramount importance concerning the future policy of the university was settled in 1921, when the trustees, in accordance with the overwhelming sentiment of the alumni, resolved that the university should continue as a private institution and not surrender its independence, as had been proposed, by becoming a state university with consequent supervision by the official representatives of the state Government.

In 1921 Gen. Leonard Wood (g.v.) was elected "head of the university under such appropriate title as may be hereafter agreed upon." Later in the year Gen. Wood was appointed governor-general of the Philippines, and was granted a year's leave of absence before assuming his duties at the university. During the World War 9,204 students and alumni of the university saw service, of whom 7,411 were in the army, 856 in the navy, 827 in auxiliary service, and 110 in the armies of America's Allies. Of these 212 died for their country's cause. (E. F. S.)*

PENSION (see 21.118).—The following summary shows the chief pension legislation in the United States during 1908-20. Legislation in Great Britain regarding pensions is described in the article following this: PENSIONS MINISTRY. An Act of March 4 1909 provided that under direction of the Commissioner of Pensions the expenses of last sickness and burial of deceased pensioners should be reimbursed. An Act of May 11 1912 granted \$30 per month to honourably discharged men who had served 60 days or more in military or naval service during the Mexican War. An Act of Feb. 19 1913 granted \$20 per month thereafter to survivors of Indian wars named in earlier Acts. An Act of March 3 1915 provided double pension in case of death of an officer or enlisted man of the navy or marine corps, or for disability of an enlisted man, resulting from an aviation accident. An Act of April 27 1916 granted a special pension of \$10 per month for life to persons whose names are entered on the "Army or Navy Medal of Honor Roll." An Act of Aug. 29 1916 granted double pension for disability or death of a student-flyer of the navy or marine corps due to an aviation accident. This Act also repealed Section 4716 of the Revised Statutes, which made disability in the Civil War a bar to a pension. An Act of Sept. 8 1916

granted \$20 per month to the widow of a Civil War veteran who was his lawful wife during the period of his service, and the same rate to the widow of a veteran of the Civil War, Mexican War, and War of 1812, on reaching the age of 70 years. An Act of Oct. 6 1917 provided a payment of \$25 per month thereafter for widows of officers or enlisted men of army, navy, or marine corps, who served in the Civil War, in the Spanish-American War or in the Philippine insurrection; this Act was amended June 25 1918 making existing pension laws inapplicable to persons in active service on Oct. 6 1917, or entering it thereafter, except in so far as rights under any such law had theretofore accrued. An Act of July 16 1918 granted widows of officers or enlisted men, volunteers and regulars, who served 90 days or more in the Spanish-American War, Philippine insurrection, or Chinese Boxer rebellion, if without means of support other than daily labour and an actual net income not exceeding \$250 per year, \$12 per month and \$2 per month additional for each child under sixteen. In case of death or remarriage of the widow, the whole pension goes to any child or children under 16 years of age. An Act of Dec. 24 1919 provided that no one should draw both pension and compensation under war risk insurance (see below). The War Risk Insurance Act was made effective as of April 6 1917. An Act of May 1 1920 granted \$50 per month from that date to persons on the roll because of Mexican War or Civil War service; and \$72 to those so nearly blind or helpless as to require personal aid and attendance; also increasing rates of pension for certain permanent specific disabilities. This Act granted \$30 per month to widows of men who served in the War of 1812 or the Mexican War, also to widows, married prior to June 27 1905, of men who served in the Civil War and to certain remarried widows, with \$6 per month additional for each child under 16 years. In case of death or remarriage of widow, the whole pension goes to any child or children under 16 years. This Act also increased the pension to army nurses of the Civil War, and dependent parents of Civil War soldiers, to \$30 per month. An Act of June 5 1920 granted pensions ranging from \$12 to \$30 to soldiers and sailors who served 90 days or more in the Spanish-American War, Philippine insurrection, or China Relief Expedition, under certain conditions as to service, the rate depending upon degree of disability or age attained; this Act also increased rates of pension for certain permanent specific disabilities.

The following table, furnished by the Commissioner of Pensions, shows the number of pensioners on the roll at the close of the fiscal year, June 30 1921, together with disbursements of pensions for that year:—

	Soldiers	Widows, etc.	Total	Disbursements
Civil War	218,775	281,327	500,102	\$246,584,639.64
Spanish-American War	31,066	8,216	39,282	6,171,569.82
War of 1812	—	64	64	24,160.21
Mexican War	109	2,135	2,244	888,024.64
Indian Wars	3,784	2,569	6,353	1,565,862.41
Regular Establishment	13,832	4,081	17,913	3,456,191.45
World War	63	32	95	25,394.37
Total	267,629	298,424	566,053	\$258,715,842.54

By an Act of May 22 1920 provision was made for the retirement of Civil Service employees and for payment to them of certain annuities based on amount of salary, length of service and age or disability. The annuity fund is created in part by the deduction of 2½% from the salaries of employees. The minimum annuity is \$180 per year, the maximum \$720. This law is administered by the Commissioner of Pensions. On June 30 1921 there were 6,471 annuitants on the roll, to whom had been paid \$2,913,547.

War Risk Insurance.—Soon after the outbreak of the World War, at the request of the Secretary of the Treasury, there was created, Sept. 2 1914, a bureau of marine insurance, under the Treasury Department, for protecting American vessels and cargoes against loss or damage. After America entered the war further legislation enacted June 12 1917, enlarged the scope of the marine bureau, make provision for insuring against loss of life or injury to officers, and crews of American vessels. Under date of Jan. 17 seven weeks after the signing of the Armistice, right to apply was withdrawn and no further insurance issued to seamen.

June 12 1917 to June 30 1919, the end of a fiscal year, the number of policies issued was 6,150; net insurance written, \$322,429,408; net premiums received, \$842,348; losses paid, \$124,724.

By Act of Oct. 6 1917 further amendment made provision for granting allowances by the Government to the families and dependents of all enlisted men. To secure this allowance the enlisted man was required to make an allotment from his pay. Two classes of allotment were established: A. compulsory allotment to a wife, child, or divorced wife awarded alimony; B. voluntary allotment to parent, sister, brother, grandchild, or grandparent. To these allotments the Government added allowances, not exceeding \$50 per month, as follows. Under Class A. \$15 per month was deducted from the enlisted man's pay and addition made by the Government to bring the monthly payment up to \$30 for a wife; \$40 for a wife and one child; \$47.50 for a wife and two children; and \$5 for each additional child. Under Class B. the Government added monthly \$10 for one parent, \$20 for two parents, and \$5 for each dependent sister, brother, grandchild or grandparent. If a man, in addition to the compulsory allotment, desired an allowance under Class B, he was required to make an additional allotment of \$5 per month. In case of no compulsory allotment, the voluntary allotment under Class B. was \$15. Class A. took precedence, and, if the entire Government allowance of \$50 was required for this, no payment was made under Class B. From Oct. 6 1917 to June 30 1920 requests for allotments and allowances numbered 1,666,607; during the same period 2,807,093 application blanks were returned without such requests. For the fiscal year ending June 30 1920 allotments paid beneficiaries amounted to \$20,748,709; Government allowances, \$32,819,927.

The Act of Oct. 6 1917 also provided compensation for death or disability of all persons in service, including women in the army and navy nursing corps, in line of duty. The recognized beneficiaries include a widow until remarriage, dependent widower, children under 18 years, and dependent mother or father. Death compensation allowed was as follows: widow, \$25 per month; widow and one child, \$35; widow and two children, \$42.50; widow and three children, \$47.50; widow and four children, \$52.50, with no further allowance for additional children. If the deceased were a woman, \$20 per month was granted for the first fatherless child, \$10 in addition for the second, \$10 in addition for the third, \$5 in addition for the fourth, and \$5 in addition for the fifth, with no further allowance for others. A mother or father was allowed \$20 per month, and, if both were dependent, \$15 each. The maximum death compensation was \$75 per month. Compensation for disability depended upon its seriousness and duration. For a man totally disabled it was as follows: unencumbered, \$30 per month; if he had a wife, \$45; if he had a wife and one child, \$55; \$10 additional each for a second and third child, with no further allowance; and \$10 additional for each dependent father or mother. At the close of the fiscal year, June 30 1920, compensation was being allowed on 42,945 death claims, and on 134,408 disability claims, the latter involving a monthly payment of \$5,036,103. In the case of disabled persons provision was also made that the Government furnish free medical service and supplies, including artificial limbs so far as "reasonably necessary."

A novel feature of the Act of Oct. 6 1917 was the provision for granting insurance at peace-time rates to any person, man or woman, in active military or naval service. Such insurance was wholly voluntary, and could be taken out, in multiples of \$500, for any amount from \$1,000 to \$10,000 inclusive, at a monthly premium rate varying from 63 cents per \$1,000 at the age of 15 to \$3.35 at the age of 65. All persons in service Dec. 14 1917 were given until April 12 1918 to apply for policies, and those entering later were given 120 days. Among the beneficiaries allowed were wife, husband, child, grandchild, sister, brother, stepbrother, stepsister, adopted brother or sister, parent, grandparent, and step-parent. A man's fiancée could not be named as beneficiary. This insurance was issued on the yearly renewal basis, to be continued as term insurance for five years after the proclamation of peace, when it would automatically expire. Privilege, however, was granted for converting this temporary insurance, in whole or in part, into one of the permanent forms of Government insurance, including ordinary life, 20-payment life, 30-payment life, 20-year endowment, 30-year endowment, and endowment maturing at the age of 62. Premiums on converted policies may be paid monthly, quarterly, semi-annually, or annually. In the case of monthly premiums, 31 days of grace are provided. If term insurance is allowed to lapse, reinstatement may be secured within 18 months after discharge from service or 12 months after lapse, but health of the applicant must be as good as it was at the time when the premium was first withheld. Never before was insurance on such a large scale undertaken. The cost of administration was assumed by the Government and not included in the computation of the premiums for term insurance. The hazards of war were ignored and peace-time terms offered, such as no commercial company could have undertaken. The inevitable loss to the Government was regarded as part of the cost of the war. All converted insurance was to be administered by the Government and not handled through commercial companies. At the time of the Armistice, Nov. 11 1918, there were on file 4,152,787 applications for insurance. Between Oct. 6 1917 and June 30 1920 there were filed 993 applications for term insurance, requesting a total insur-

ance of \$40,284,892,500, an average of about \$8,697. On the last-mentioned date there had been issued 4,610,185 certificates for term insurance. The amount involved exceeded that in all commercial life insurance companies and fraternal organizations of the United States combined. About 98% of the enlisted personnel had taken advantage of this unprecedented opportunity. Every effort was made to induce policy-holders to convert their war-risk insurance into some form of permanent Government insurance, but by far the greater number allowed their policies to lapse. In 1921 all the activities concerning the welfare of ex-service men were consolidated in the Veterans' Bureau.

PENSIONS MINISTRY (Great Britain).—Before the World War the Admiralty and the War Office were responsible in the United Kingdom for the award and payment of service and disability pensions. The commissioners of the Royal Hospital, Chelsea, acted for the War Office in respect of pensions to warrant officers, N.C.O.'s and men. Pensions to privates and N.C.O.'s were paid quarterly by the regimental paymaster, those to officers and warrant officers by the paymaster-general. In the financial year 1913-4 there were in round numbers 60,000 service and 25,000 disability pensions for the army (men), and for the navy 33,000 and 7,700 respectively. The total annual cost to the State was £3,695,000. In the subsequent changes the disability pensioners were transferred to the new organizations, the service pensions remaining unaffected.

The first war alteration was made in Sept. 1914. A Central Army Pension Issue Office was set up and weekly instead of quarterly payment of pensions was authorized. Next, by the War Pensions Act 1915, the local war pensions committees were set up, under a statutory central committee "for the purpose of administering supplementary assistance in case of hardship and providing for the after-care of disabled officers and men." These committees were appointed under schemes of local authorities, more than half the membership being nominated by these authorities. The Ministry of Pensions was subsequently set up by the Act of Dec. 1916. This transferred to a minister responsible to Parliament the powers and duties of the Admiralty, the War Office, and the Chelsea Commissioners "in respect of the administration and payment of pensions and grants to officers and men, to their widows, children and dependents and to persons in the nursing service of the Naval and Military forces," the administration of service pensions being left with the service departments. It was provided that the powers and duties of the statutory committee above referred to should be continued under the control of the minister, who should communicate through it with the local committee. This arrangement proved unworkable, and in 1917 a new War Pensions Act dissolved the statutory committee and transferred its powers to the minister. A pensions appeal tribunal was set up. In 1919 a further Act conferred a statutory title to pension, subject to the conditions of the royal warrant. Previously it had been, in theory, only an act of grace. Independent statutory appeal tribunals were also appointed.

In the Ministry of Health Act (1919) provision was made for the transfer by order in council of "all or any of the powers and duties of the Ministry of Pensions with respect to the health of disabled officers and men after they have left the service" to the Minister of Health, at a date "not earlier than one year or later than three years after the termination of the present war." A further addition to the series of the Pension Acts was made in 1920, when an Act was passed providing that after the termination of the present war fresh cases were not to be transferred to the Ministry of Pensions, but were to remain, as in pre-war days, under the care of the War Office and Admiralty respectively, to whom the Air Ministry must now be added. Finally under the War Pensions bill of 1921, it was proposed that the large proportion of temporary awards should be converted into permanent awards, a right of appeal being granted to the pensioner. The period was to be within four years of his discharge from the service or after the first award of a pension to him. The administrative functions of the local war pensions committees were also to be limited and the numbers of these bodies reduced.

Award of Pensions.—Pension finance, generously revised at the outbreak of the World War, was reorganized from time to time in

accordance with the changing type of recruits and the rise in the cost of living. The scales of 1917 and 1918 were again considered in 1919 by a select committee of the newly elected House of Commons, which settled the rates governing payments till 1923. The principle of payment is that of compensation for disablement attributable to or aggravated by war service. "Disablement" is assessed by purely medical opinion, in terms of a percentage reduction from the standard of a normal healthy man. The pension is on a flat rate graded from 20% to 100%; below 20% only a lump sum is awarded payable usually in weekly allowances. Pensions are in the first instance awarded temporarily—usually for 12 months—and remain temporary till the disability has reached its final and stationary condition, when they are made permanent. The patient is subject to periodical medical examination during this time, and at each "board" his disability is reassessed for the next period. In addition the principle was laid down in 1917 that no account was to be taken of the earnings of disabled men. The "alternative pension" was also provided whereby a man might obtain a pension (within certain limits) running up to his full pre-war earnings, which by the Warrant of 1919 were further loaded up by 60% on account of the increased cost of living. Widows, also, may choose alternative pensions (husband's earnings plus 60%), and this right has been exercised in a large number of cases. The new pension scales were not to be subject to revision before April 1923.

The following figures may be quoted from the Warrant of 1919:—

(1) Totally disabled (privates):	
Man	40s.
(+ attendance allowance up to 20s. if helpless)	
Man and wife	50s.
Man, wife and one child	57s. 6d.
Man, wife and two children	63s. 6d.
For each additional child	6s.
(2) Widows:	
Childless	20s.
(+ 6s. 8d. if aged 40).	
With one child	36s. 8d.
With two children	44s. 2d.
For each additional child	6s.

Although the assessment of disablement is a purely medical matter, the question of entitlement (i.e. whether due to war service) is decided by medical and lay opinion combined. The claimant has an appeal against the assessment of a medical board to a medical appeal tribunal; he may similarly appeal against refusal of entitlement to one of eleven statutory pensions appeal tribunals set up under the 1919 Act. These are appointed by the Lord Chancellor and are independent of the Ministry of Pensions.

Constitution.—In 1918 the Ministry consisted of the following branches: (1) Finance (including pensions issue office); (2) awards (men); (3) awards (men's widows and dependents); (4) awards (officers and officers' widows and dependents, and medical treatment and training of officers); (5) local administration; (6) medical services; (7) vocational training; (8) artificial limbs; (9) surgical appliances; (10) chief inspector; (11) special grants committee. The only important change in these divisions has been in the case of vocational training, which in 1919 was transferred to the Ministry of Labour (save for convalescent centres associated with medical treatment).

In April 1919 a scheme of regional decentralization was begun, and during the following 12 months 11 regions were set up. Each is governed by a director, assisted by a commissioner of medical services, a regional administration officer, an awards officer, a finance officer, a registrar, and staff. These regional offices carry on (1) medical examination; (2) awards of pensions; (3) control of Ministry hospitals; (4) supervision of the local war pensions committees.

The Ministry itself, whose staff had numbered at its inception in 1917 2,296, expanded with its work to 5,754 in its first year, and in 1921 had reached 26,000, which included 8,000 hospital staff. (Of the male staff at this date 94% were ex-service men.) The local war pensions committees then numbered 349, with nearly 1,000 sub-committees. They had 27,500 members and a paid staff of 6,200 in addition to many voluntary workers. Space precludes more than a mention of the special grants committee, the chief function of which is to make supplementary and special grants where need exists, under regulations approved by the Ministry of Pensions.

Duties.—The machinery was great, but the burden was gigantic. By 1917 (when the Ministry came into being) 262,000 pensions in all had been granted. The number was doubled in the following 12 months. The increase continued rapidly; at one time as many as 35,000 new awards were made in a week. The pressure was greatest in the first six months of 1919, when demobilization was at its height. It was estimated at the beginning of 1921 that the crest of the curve had been reached; cessation or reduction of temporary pensions had begun to balance new awards, and medical treatment to be commensurate with the demand.

The subjoined figures have been taken as exemplifying the business of State pensioning at its maximum. (The figures are approximate and are taken from the estimates for 1920-1.)

Cost of administration 1920-1, including medical services, and local war pensions committees	£5,000,000
--	------------

Cost of local war pensions committees (administration)	£1,150,000
Money disbursed through local war pensions committees 1920-1 (recoverable advances, treatment allowances, etc.)	£20,000,000
Estimated total cost of pensions including medical services and administration expenses	£123,000,000

From these sums were treated or maintained, partially or wholly, both the World War and pre-war disability pensioners (the awards of these last by the Royal Warrant of 1917 had been levelled up to the corresponding war scale). The total number of awards had increased from 262,000 in 1917 to 1,849,000 at Dec. 31 1920, made up as follows:—

Disabled men	1,216,000
Widows	226,000
Dependents	384,000
Children	23,000

The pensions, temporary and permanent, actually in payment on Dec. 31 1920 were:—

Disabled men	1,180,000
Widows	169,000
Dependents	362,000
Children	16,900

In addition the following first awards of disability retired pay or pension had been made:—

Officers	56,487
Officers' widows	10,408
Officers' children	11,302
Officers' other dependents	7,077
Nurses	2,045
Nurses' dependents	22

In payment on Dec. 31 1920 (approx.):—

Officers	38,850
Officers' widows	9,700
Officers' children	9,100
Officers' other dependents	6,500
Nurses	1,458
Nurses' dependents	22

Including wives' allowances, and children's allowances the total number of beneficiaries was nearly 3,500,000.

Medical treatment was being carried on in 84 hospitals and convalescent centres and 150 clinics. The Ministry controlled 14,000 beds in its own institutions and 10,000 in civil institutions (cf. the whole voluntary hospital system of the country, which has not more than 40-50,000 beds). There were under treatment at any given time 158,000 cases. The cost of this, including allowances to men under treatment, in excess of pension, amounted to £16,000,000 per annum. The doctors directly employed were 464, the hospital staff numbered 7,600; in addition, for assessment purposes, there were 450 medical boards, each of three members, examining over a considerable period from 21,000 to 25,000 men every week.

Special Features.—In addition to the mere mass of the task, many most baffling problems demanded solution. The Ministry, in addition to pensions work and medical treatment, had for example to undertake the supply and repair of artificial limbs and surgical appliances (a special division of the Ministry was organized to deal with this). There were in Dec. 1920 23,932 officers and men pensioned on account of amputations of the leg, and some 64,000 cases of wounds of the upper extremity involving amputation of arm or part of the hand. There were 8,000 cases of epilepsy, 114,000 cases of "heart disease" and 69,000 cases of nervous disease (under which are included both "shell shock" and "neurasthenia").

There was no medical staff in existence to cope with such numbers. In the case of the "nervous diseases" a special training school for psycho-therapy and other forms of treatment was established in London, where a four months' course was given. The problem of "heart disease" demanded specialist attention; a system of special cardiological boards and clinics for examination and diagnosis was started in London, and extended throughout the country.

For the concurrent treatment and training of the broken men six large centres had been opened by Jan. 1921, and it was intended to open two more, giving accommodation in all to between 3,000 and 4,000. The effects of concurrent treatment and training upon the health and prospects of the patients were extremely beneficial. Difficulties were experienced in their absorption in industry, and efforts were made to overcome this by the institution of a national Roll of Honour by which firms pledged themselves to employ a certain proportion of disabled men, while special treatment for the permanently unfit was being considered. (W. E. EL.)

PERCIN, ALEXANDRE (1846-), French general, was born at Nancy (Meurthe) on July 4 1846. He entered the École Polytechnique on Nov. 1 1865, and two years later was appointed a sub-lieutenant of artillery. He was promoted lieutenant in 1869 and captain in 1870. He took part in the Franco-German

War and the commune fighting and was twice wounded—in Dec. 1870, at the battle of Patay, and again in April 1871 before Paris. He was made a major (*chef d'escadron*) in Jan. 1883, lieutenant-colonel in 1890, colonel in 1895, general of brigade in 1900, and general of division in 1903. In the period between 1900 and his retirement, Gen. Percin was a very active reformer and innovator in the tactics of the artillery arm. The typical field-artillery tactics of 1914, based on time shrapnel covering fire, and on the intimate liaison of infantry and artillery, were largely due to his work, and after his retirement he continued a very active student and critic of artillery operations. His marked personality, and his political opinions as a radical, however, made him many enemies. At the outbreak of the World War he was recalled to service, but only as commander of the Lille region, and he was involved in the controversies connected with the evacuation of Lille. Later he was employed for a short period as inspector-general of artillery units. In Jan. 1915 he was placed in the reserves. He was given the Grand Cross of the Legion of Honour in June 1917.

Amongst his more important works are *La Manœuvre de Lorraine*, *L'Artillerie aux Manœuvres de Picardie* (English translation, War Office, 1912) and a psychological study of battle under the title *Le Combat* (1914).

PERCIVAL, JOHN (1834-1918), English divine, was born in Westmorland Sept. 27 1834, the son of William Percival, of a yeoman family. He was educated at Appleby and Queen's College, Oxford, where he took his degree in 1858. In 1860 he was ordained, and went to Rugby as an assistant master. In 1863 he went to Clifton College as first headmaster, remaining there for 15 years. He was elected president of Trinity College, Oxford, in 1878, and while in this position took much interest in the foundation of Somerville College for women. In 1887 he became headmaster of Rugby, and in 1895 was appointed to the bishopric of Hereford. His broad churchmanship placed him in opposition to the dominant tendency in the Church of England, and he was also a strong and militant Liberal in politics, being an ardent advocate of the disestablishment of the Church in Wales. He died at Oxford Dec. 3 1918.

PÉREZ GALDÓS, BENITO (1843-1920), Spanish novelist (see 21.139), died Jan. 4 1920. The final series of his *Episodios Nacionales* contained *España sin rey* (1908); *España Trágica* (1909); *Amadeo I.* (1910); *La Primera República* and *De Cartagena a Sagunto* (1911); and *Canovas* (1912). He also published various plays and novels, including *El Caballero encantado* (1909), and *Santa Juana de Castilla* (1918).

See I. Olmet and A. Carraffa, *Los Grandes Españoles*, vol. i., Galdós (1912).

PERIODICALS: see NEWSPAPERS.

PERISCOPE.—An optical instrument used in land warfare and in submarine navigation, enabling an observer to see in all directions while remaining under cover or submerged. Essentially it consists in an optical system of lenses and mirrors, or mirrors alone, the upper part of which projects from cover, or from the deck of a submarine, while the observer looks into the lower end, receiving an image of the surrounding country or sea by reflection down a tube.

The use of reflecting mirrors for the purpose of observing from cover is no novelty, and during the trench warfare of the Crimean War 1854-5 a device was patented which scarcely differs from the simple mirror periscope of the World War. From the beginning of the 20th century, however, the practical introduction of submarine navigation brought about the development of new elaborate periscopes of great length and provided with an optical system of lenses, which were built into the structure of the submarine. At the same time, on land, the new necessities imposed on field artillery by the growing use of covered positions led to the development of scissors-telescopes (see RANGEFINDERS) and panorama-telescopic sights (see SIGHTS), in which the optical system was arranged with the tube of the telescope vertical and the object-glass and eyepiece systems at right angles to the axis of the tube. And in the World War, optical instruments of this kind, were elaborated and

improved, the periscope as such came into use for the infantry garrisoning trenches. Manufactured in large quantities it soon became an essential part of infantry as well as of artillery and machine-gun equipment. In the present article, periscopes for land service and those forming part of the equipment of submarines will be described in turn.

(1) *Land-service Periscopes* vary much both in design and size, some being only a few inches long while others are as much as 80 ft. in length. The simplest form of periscope, and that most generally used by troops, consisted of a tube, rectangular in section, provided with two mirrors, the upper of which, inclined at an angle of 45° to the axis of the tube, reflected the image of the foreground vertically downwards to a second mirror, also inclined to the axis at 45° into which the observer looked. But in order to obtain an adequate field of view, the mirrors, and therefore the box, had to be made somewhat large, and in the close-quarters conditions of trench warfare even the few inches by which they projected over the parapet or other cover made them sufficiently obvious to draw fire. Less conspicuous periscopes were therefore designed, and these, in order to take in enough of the foreground, had to be provided with a magnifying as well as a reflecting system. In the British service half of the stereoscopic scissors-telescope used in range-finders was frequently employed as a periscope. Its lower end was fitted with a ball-and-socket joint to enable it to be laid in any direction, and beneath this is a screw which can be screwed by means of a small lever into a piece of wood embedded in the side of a trench.

In an ingenious periscope designed by Messrs. R. & J. Beck of London (fig. 1) the upper prism is supported above the telescopic system on a flat strip of metal which can be slid through side supports on the body of the periscope. When in use, the prism is supported some inches above the body and is the only part that can be seen by the enemy. If it is shot away, it can be replaced in a few seconds. When the periscope is not in use, the prism is lowered and protects the upper lens in the body.

Small German periscopes were usually 1 metre or $\frac{3}{4}$ a metre in length and had two eyepieces giving magnifications 10 and 15 diameters. The optical system is shown in fig. 2. They could be either held in the hand or attached to a direction stand.

A neat rainguard made of sheet metal, to the same curve as the body of the periscope and almost 8 inches long, is attached to the upper prism box by two spring straps. When in use, it is held at right angles to the periscope above the upper window by a bayonet catch; when not in use, it is lowered and sprung round the body of the periscope just below the upper prism box.

FIG 2

Many periscopes of considerable length and special design have been used, to enable observations being made in comparative safety from behind large objects, e.g. houses, trees, etc., or from folds in the ground. Of these the most remarkable is the German *Giant Periscope*, two specimens of which exhibited in the collection of trophies in the Imperial War Museum, Crystal Palace, have excited considerable popular interest. This periscope is considerably larger than any others, and was designed for observing over obstacles of between 9 and 26 metres in height. It can be rapidly erected or taken down and transported on its carriage. It consists mainly of 3 parts, viz. a steel telescopic mast and upper and lower optical systems which are attached to it.

The telescopic mast is carried in trunnions on the carriage, and travels closed and in a horizontal position. Gears are provided for elevating, levelling, aligning the upper and lower optical systems, adjusting the inclination of the reflector and rotating the mast around a vertical axis so that observations may be made and azimuth angles taken in all directions. The

FIG 1

telescopic mast consists of 8 tubes. The lower one is attached to the carriage, and the upper one is pulled out as far as it will go and retained in position by catches before the mast is raised. The other six are connected to each other and to the lowest one by wire

cables and pulleys in such a way that when the cable which connects the two lowest tubes is wound in by means of a winch, each of the tubes except the fixed one will rise within the next one

through the same distance. When erect, the mast is steadied by means of three guy ropes.

The details of the optical systems are as follows: The rays from a distant object after passing through a protecting window A (fig. 5)

are reflected by a mirror B down the centre of the conical casing which contains the upper optical system and is attached to the top of the mast. The two achromatic lenses, C and D, bring the rays to a focus on the plane surface of the large lens, E, forming an image there. Immediately above this plane surface and almost touching it is a system of wires which enables angular distances from the centre of the field to be read at the eyepiece below. The mirror can be elevated and depressed by means of a flexible shaft which passes up the centre of the mast and actuates gear attached to the mirror frame.

From the large lens, E, the rays pass through the open air for a considerable distance, depending upon how much the mast has been raised, to the lower optical system. Here they pass through the lenses and prism shown into one of the eyepieces, F. By moving the lens G up and down the image can be formed in the correct position for the eyepiece at all extensions of the mast.

There are three eyepieces which are mounted on a revolving sleeve in such a way that any one of them can be quickly brought into use, to give the magnification suitable to the height of the mast. (Low power from 3 to 8; medium from 5 to 14; high from 7 to 21.) Each eyepiece is provided with a dummy eyepiece which comes opposite to the eye which is not observing and permits of it being kept open. This lessens eyestrain. Coloured anti-glare glasses are provided.

(2) *Submarine Periscopes.*—When a submarine is completely submerged the occupants are not able to see through the water except under very exceptional conditions. In the Mediterranean on a sunny day it is possible to see for several yards

through the water at about 25 ft. below the surface. In the North Sea, and usually, it might be said that once the boat is submerged, direct observation through the water is impossible. In the very earliest submarines a cupola was built on the top of the hull, which was kept just above the surface when it was desired to take observations. To reduce resistance, these cupolas were made telescopic in the French submarines "Gymnote" and the "Gustave Zédé," but the arrangement proved unsatisfactory. An optical tube replaced this cupola in the "Gustave Zédé," and comprised a short tube (on top of the submarine) with a lens to close the top end, which was kept just above the surface when running submerged. Horizontal rays of light entering at the top were reflected by a prism down the tube and focussed on to a sheet of paper in front of the helmsman inside the submarine. This gave him a limited view of what lay directly ahead. The word "periscope" was first applied to this instrument.

The modern submarine periscope consists essentially of a long tube, the top of which is just above the water when diving, while the lower end passes through a stuffing box on the shell of the boat into the control-room. The top is closed by a pressure-tight window, inside of which is a prism which reflects the light rays vertically down the tube to a prism at the bottom end, where they are reflected in a horizontal direction and focussed in an eyepiece attached to the bottom of the tube. Thus the commander can see what is happening on the surface when navigating the submarine some 20 ft. or more below it.

The greater the depth of submergence the less the disturbance made by the submarine on the surface of the water, and the greater the immunity from gun-fire, ramming, etc.; also in a sea-way the deeper the submarine the more readily is it controlled. For these reasons the length of the periscope has steadily increased, and the dimensions of the upper end have as steadily decreased. Increased length necessitated an increase in the diameter of the main tube to limit the amplitude of the vibrations caused by being pushed through the water. A typical instrument in the British navy was 30 ft. long, with a 5.9 in. diameter main tube, and the top 3 ft. of the upper tube 2 in. diameter. For the German "U" boats Messrs. Zeiss made a periscope 7 metres long, main tube 150 mm. (5.9 in.), and about 2 ft. 6 in. of the top tube 30 mm. (1.2 in.) diameter.

The main tube must be accurately machined as it has to be readily trained in its stuffing-box as well as be water-tight in all positions through a considerable range of vertical travel. The modern practice is to take rapid observations rather than to keep the periscope above the water all the time. To facilitate this mechanical lifting, gear is provided which is readily controlled, and can raise or lower the periscope at a speed approaching 25 ft. per minute.

The field of view is usually about 40° at a magnification of 1. It is therefore necessary to train the periscope round when taking observations on different bearings. This can be done in two ways: either by rotating the optical train inside the main tube, or more usually the case, rotating the whole periscope. The increase in weight and size the effort required has increased, and power training has sometimes been necessary. When

however, by refinements in workmanship, etc., efforts are made to keep the torque required so low as to be within the power of the operator. Usually a revolving scale round the edge of the field shows the direction of the view. If the whole instrument moves, the operator also moves round with it in the boat, and knows at once in which direction he is looking.

Owing to proximity to the magnetic compass the whole of the tube must be non-magnetic. High-strength bronze was used in the earlier practice in the British navy. A special nickelchrome steel was manufactured and machined by Messrs. Krupp for use for the outer tube of the German navy periscope used before the war, and a similar steel was developed and used in the British service, but it is costly and more difficult to machine to the required accuracy than is the case with bronze.

The use of aircraft for anti-submarine work led to the demand for a periscope which could be used for looking overhead. In the sky-searching periscope the upper prism can be rotated by mechanism inside the periscope, so that aerial observations can be readily made before the submarine "breaks surface."

To enable a distant ship or other object to be examined more closely it is possible in some periscopes to change the magnification from a normal power of 1.5 to a power of 6. This, and the sky-searching previously mentioned, means increased internal gearing and a larger upper tube. As a rule every submarine has at least two periscopes, one unifocal with a small upper tube and the other bifocal and sky-searching with a larger upper tube.

Whilst in the British service sky searching up to right overhead was arranged for, German periscopes as a whole are limited to 20° above the horizontal. In each case 10° depression is allowed for to follow the roll of the submarine.

For special purposes other features are added, such as range-finding attachments, etc. A "night" periscope for use at dusk has been developed. It is much shorter than the typical instruments described, so that the maximum brightness of image is obtained.

The periscope when installed in the submarine is used for two purposes: (a) general observation for submerged navigation; (b) for correctly aligning the submarine when firing a torpedo at a target. In connexion with (a) the principal requirement is clearness of field. Continuous use of a periscope is very trying for the observer's eyes, and for use in bright weather light-filter screens are provided to reduce the glare. It has also been found that in foggy and misty weather suitable colour screens are of assistance. These screens are usually embodied in the eyepiece. For purposes of torpedo attack the periscope is used as a range-finder to determine the distance the target is away, and also in connexion with tables to determine the correct time to fire the torpedo, allowing for the speed of the enemy, course, etc. Officers of submarines have devised various mechanical devices to avoid calculations, and these have been added to the periscope. Although two periscopes are provided when attacking, one only would be shown for short periods to get check observation so as to prevent the wash of the upper tube revealing the proximity of the submarine.

PERKIN, WILLIAM HENRY (1860–), English chemist, was born at Sudbury, England, in 1860, eldest son of Sir William Perkin, founder of the aniline dye industry. He received his general education at the City of London School, and his scientific education at the Royal College of Science, South Kensington, and at the universities of Würzburg and Munich. During 1883–6 he held the position of *Privatdozent* in the university of Munich. In 1887 he returned to England and became professor of chemistry at the Heriot-Watt College, Edinburgh. In 1892 he accepted the chair of organic chemistry at the Victoria University, Manchester, which he held until 1912. During this period his stimulating teaching and brilliant researches attracted students from all parts, and he formed at Manchester a school of organic chemistry famous throughout Europe. In 1912 he succeeded Prof. Wm. Odling as Waynflete professor of chemistry at Oxford. He soon made his influence felt there—new and more extensive laboratories were built, and for the first time in England a period of research became a necessary part of the academic course in chemistry for an honours degree. Prof. Perkin was president of the Chemical Society from 1913 to 1916. He was awarded the Longstaff medal of the Chemical Society in 1900, and the Davy medal of the Royal Society in 1904. The main results of his work are embodied in a very numerous and brilliant series of papers in the *Transactions* of the Chemical Society. The earlier papers deal chiefly with the properties and modes of synthesis of cloud chain hydrocarbons and their derivatives. This work led naturally to the synthesis of many terpenes and members of the camphor group; also to the investigation of various alkaloids and natural colouring matters. In addition to his scientific work Prof. Perkin always kept in close touch

with chemical industry. His text-books on practical chemistry, inorganic and organic chemistry, written in conjunction with Prof. Kipping, are in general use.

PERNERSTORFER, ENGELBERT (1850–1918), Austrian politician, was born on April 27 1850 at Vienna, the son of a small master tailor. While still a lad at the *Gymnasium* he had to earn his living by giving lessons. At the *Schottengymnasium* he struck up a close friendship with Viktor Adler, and became interested in the Pan-German political movement. While still at the *Gymnasium* he gave courses of lectures at the Workmen's Education Union. At the university he came into contact with Schönerer, to whose intimate circle he belonged. He collaborated in the preparation of the so-called Linz programme of the Left National party, and for a quarter of a century, from 1881 onwards, he edited the periodical *Deutsche Worte*. He separated from Schönerer as the latter adopted an increasingly reactionary and anti-Semitic attitude. He was also the inspirer and one of the founders of the German School Union. In 1885 he was elected to the Austrian Parliament as independent candidate for the manufacturing centre of Wiener-Neustadt. From that time, with the exception of the electoral period 1897 to 1901, he sat in Parliament until his death, and from 1907 onwards was its vice-president. In 1907 he became president of the parliamentary Social Democratic party, which had in the meantime increased in number to 87 in consequence of the adoption of universal suffrage. He died, after a rather long illness, in Vienna on Jan. 7 1918.

PERRY, JOHN (1850–1920), British mathematician, was born in Ulster Feb. 14 1850 and educated at Queen's College, Belfast. Though he took a post as a schoolmaster in 1870, he also qualified as an electrical engineer and devoted much of his time to turning mathematics to practical account. He served for a time as assistant to Lord Kelvin. Later he was associated with Prof. Ayrton and together they were responsible for many inventions in electrical apparatus (see 3.76, 8.782 and 783, 9.236, etc.). In 1881 he became professor of engineering and mathematics at the City and Guilds of London Technical College and in 1896 professor of mathematics and mechanics at the Royal College of Science, retiring in 1914. He published many books on applied mathematics and did much to further scientific engineering, especially by his lectures to operatives and by such works as *The Steam Engine* (1874), *Spinning Tops* (1890), *The Calculus for Engineers* (1897), etc. During the World War he was an adviser on gyroscopic compasses. He died in London Aug. 4 1920.

PERSHING, JOHN JOSEPH (1860–), American soldier, was born near Laclede, Mo., Sept. 13 1860. He studied at the Kirksville (Mo.) Normal School (B.A. 1880); graduated from the U.S. Military Academy in 1886; was commissioned second-lieutenant and immediately assigned to the 6th Cavalry in a campaign against the Apaches in Arizona. His conduct won the praise of General Nelson A. Miles, and in 1890, during an uprising of the Sioux, he was sent to Dakota, in charge of the Indian scouts. In 1891 he was appointed military instructor at the university of Nebraska, remaining there four years. He entered the law school and received the degree of LL.B. in 1893, having been made first-lieutenant the preceding year. In 1897 he was appointed instructor in tactics at the U.S. Military Academy, but on the outbreak of the Spanish-American War (1898) asked to be assigned to active duty. He served in Cuba through the Santiago campaign, was appointed chief of ordnance with the rank of major of volunteers, and in June 1899 assistant adjutant-general. He organized in Cuba the Bureau of Insular Affairs of which he was head for several months. In Nov. 1899 he was sent to the Philippines as adjutant-general of the Department of Mindanao, and in 1901 was honourably discharged from volunteer service. The same year he was made captain in the regular army and later conducted a campaign against the Moros, which he completed with success in 1903. The same year he returned to America and was appointed a member of the General Staff. In 1905 he went to Japan as military attaché to the American embassy, and during the Russo-Japanese War spent several months as military observer with the Japanese army in Manchuria. As a reward for his success in the Philippines President

Roosevelt in 1906 finally secured his promotion from captain to brigadier-general, passing him over 862 senior officers. Soon after he returned to the Philippines as commander of the Department of Mindanao and governor of the Moro Province. Here again he was engaged in quelling the insubordinate Moros until his decisive victory at Bagsag June 12 1913. He was then placed in command of the 8th Brigade at San Francisco. While he was temporarily absent in 1915 on duty at the Mexican border his wife and three young daughters lost their lives in a disastrous fire, but his son was rescued. In March 1916 he was put in command of the punitive expedition into Mexico against Francisco Villa, and the same year was made major-general. After the death of Maj.-Gen. Funston in 1917 he succeeded him as commander of all the American troops on the Mexican border. This position he held until America's entrance into the World War, and was then chosen to command the A.E.F. in Europe. With his staff he reached England June 9 1917, and four days later landed in France to prepare for the coming of the American troops. In Oct. 1917 he was made general, U.S.A. In some quarters it was felt that as the American detachments arrived they should be hastily trained and then distributed among the Allied forces already in the field, but from the start General Pershing insisted upon the integrity of the American army, though willing in cases of emergency to place detached American units in the different Allied armies. He was convinced that the presence of an independent American army would be a serious blow to German *moral*. In Dec. 1917 he forbade American soldiers the use of alcoholic drinks, excepting light wines and beer, allowing these only in deference to French customs. As Commander-in-Chief of the A.E.F. he planned the American attack at the Marne salient in 1918, as well as American operations at St. Mihiel and in the Meuse-Argonne. His management of the A.E.F. is clearly described in his succinct *Final Report* (less than 100 pages), issued by the Government Printing Office, Washington, Dec. 1919. His nomination by President Wilson to the permanent rank of general was confirmed unanimously by the U.S. Senate Sept. 1 1919, a grade held previously by only four Americans—Washington, Grant, Sherman, and Sheridan. In 1921 he was appointed Chief-of-Staff. By King George V. he was given the decoration of G.C.B.

PERSIA (see 21.187).—The autumn of 1909 was a turning point in Persian history. The despotic Shah had abdicated, thus ending the bad old order. Great Britain and Russia were sympathetic to Persia, the latter Power not only appointing a minister with liberal ideas, but withdrawing her troops gradually from Kazvin and Tabriz. In other words the field was clear and Persia had every chance of setting her house in order. The new Assembly met in Nov., when Siphahdar read a speech from the throne, full of good intentions. Nor did his Cabinet fail at the first difficult task. When the question of disbanding the *mujahidin* or "warriors of the Holy War" arose, these soldiers of fortune, for the most part, assumed a menacing attitude and threatened to mutiny unless their exorbitant demands for pay were granted, but the matter was finally settled without bloodshed. Far more dangerous was the discord that raged among the Nationalists, who again broke up into two parties, the "Revolutionaries" (now mis-named "Democrats") being bitterly hostile to the Moderates. Unfortunately the former party, by its activity, its violence, and its secret organization, gained the ascendancy. Nor were the leaders any better, Sardar-i-Assad, the Bakhtiari chief, intriguing with the "Revolutionaries" against Siphahdar. The raising of a joint loan of £500,000 from the two Powers, mainly to provide the pay due to the police and soldiers, encountered stormy opposition in the Assembly and was not carried through. The "Revolutionaries" forced their way into the Cabinet, with the result that no progress of any kind was made.

Siphahdar ultimately resigned and a "Democrat" Cabinet was formed under the influence of Sardar-i-Assad, whose nominee for the premiership was a Kajar prince, Mustaufi el Mamluk. It was hoped that office would sober the "Democrats," but little sense of responsibility was shown, together with an intense craving for the sweets of office. Generally speaking the Majlis made

Cabinet rule impossible. It was broken up into several parties swayed by passion, intrigue or greed for money, and would lightly pass votes of censure whenever an incident which appeared to be unfavourable to Persia was reported, without giving the minister concerned the chance of explaining matters. Moreover, the hostility of the Majlis and of the Cabinet towards Russia was exasperating to the northern Power.

Chronic Disorder.—In the autumn of 1909 M. Passek, Russian consul-general, was attacked by tribesmen, when travelling to Shiraz with an escort of Cossacks. A few months later, the British consul was attacked near Abadeh and two Indian sowars of his escort were killed. The authority of the governor-general of Fars was threatened by the Kashgais. In the N., adherents of the ex-Shah drove the governor from Ardebil, and Russia was suspected of being implicated in this plot—probably with justice. Elsewhere in northern Persia there was little disorder compared with the unsatisfactory state of affairs in Fars, which gravely threatened British commerce and other interests. So much was this the case that Great Britain began to consider the situation as one that might demand British intervention, and, in the autumn, the Persian Government was notified that, failing the restoration of order within three months, Persian levies under British officers would be raised to guard the trade routes.

In the autumn of 1910, Nasir el Mulk was elected regent in the place of the deceased 'Azud el Mulk, and reached Teheran at a critical time. Mustaufi had been obliged to resign; Siphahdar again formed a Cabinet and Sardar-i-Assad had left for Europe. The new Cabinet was settling down when the ex-Shah, who had passed across Russia with munitions labeled "Mineral Waters," suddenly landed near Asterabad. At first, there was a panic at Teheran. Siphahdar, whose loyalty to the constitution was suspect, was induced to resign, his place being taken by the Bakhtiari chief Samsam es Sultaneh. The ex-Shah marched on Teheran while Salar ed Dauleh simultaneously advanced on the capital from Kermanshah. The Russians undoubtedly favoured the ex-Shah, but his troops were defeated, as was the horde of tribesmen under Salar. Finally the ex-Shah retired to Russia, mainly because Great Britain declined to consider the question of his return to the throne.

American Financial Mission, 1911.—The financial troubles of Persia were mainly due to the all-pervading corruption and irresponsibility of the governing class. It is to the credit of the "Democrats" that an effort was made to deal with the situation by engaging the services of Mr. Morgan Shuster, an American, as financial adviser. Upon examining the situation, Mr. Shuster realized that, without extraordinary powers, he could do little. He therefore demanded the powers of a dictator, which were granted him by the "Democrats," with whose views he found himself in sympathy. Russia regarded his actions with hostility. He was advised by the regent to reorganize everything else before interfering with the comparatively model organization of the customs under its Belgian officials. Instead of following this sound advice, he began work with the customs, exciting deep animosities. Indeed, in many ways, he ignored the realities of the situation. To take an important instance, Shuster wished to organize a Treasury gendarmerie and offered the task to Maj. C. B. Stokes of the Indian army, whose appointment as military *attaché* was expiring. Stokes was a Russophobe, owing to his strong pro-Persian proclivities, and Russia firmly objected to an appointment which would give him control over men stationed in every part of Persia. The matter caused much stir and was finally settled by Maj. Stokes being ordered to leave Persia and return to India. This was a rebuff to Shuster, but worse was to follow. The Russian Government was determined to oust him, but took action on a weak case. The Treasury gendarmes seized the principal property of Shu'a es Sultaneh, the young Shah's uncle, who had taken part in the ex-Shah's attempt. Actually he was a Turkish subject. However, the Russian consul-general, under the flimsy pretext that Shu'a owed money to the Russian Bank, sent some Russian Cossacks, who ordered the Treasury gendarmes to retire under threat of opening fire on them. A guard of Persian Cossacks was subsequently posted by orders of the Russian consul-general. On the following day Shuster dispatched a much stronger body of Treasury gendarmes who ejected the Persian Cossacks. Russia regarded this foolish act as a challenge and presented an ultimatum demanding an apology for the insult offered to her consul-general. When this had been accepted, she demanded the dismissal of Shuster. The Majlis at first refused with cries of "Death or Independence," while at Tabriz and Resht attacks were made on the Russians, who dealt sternly with the incidents, hanging the leading ecclesiastic and other notables at Tabriz. Russian troops supported

the ultimatum by marching on Teheran, and the Persians, recovering from their fond illusions, submitted. The failure of Shuster was disappointing. His selection was, perhaps, unfortunate, but, in any case, Russia would hardly have permitted him to succeed.

Bombardment of the Meshed Shrine, March 1912.—There were few acts more discreditable to Russia or more harmful to her true interests than the bombardment of the shrine of the Iman Riza, the chief centre of pilgrimage in Persia. The Russian consul-general at Meshed, who was determined to play a hostile rôle in Persia, had taken advantage of local disturbances to bring in a large Russian force under a major-general. There was no need for this, and the population, cowed by its arrival, was peaceful. This state of affairs, however, was not allowed to continue, as it meant no honours and no loot for the Russians. A notorious agent provocateur was sent to the shrine, where he soon collected large crowds to listen to his incendiary speeches. This was all that was necessary and the shrine was bombarded by the Russians, nominally to expel the agitators. Actually they were taken away by night in a waggon under a Russian escort. Many innocent men and women were killed and wounded; the sacred tomb-chamber in which lie the remains of Persia's saint, close to those of Harun al Rashid, was repeatedly struck by the shell-fire; and the treasury, which contained the rich gifts of countless pilgrims, was removed, but was afterwards restored, although by no means intact. The outrage excited intense feeling in Persia and, to a lesser degree, throughout the Moslem world. It demonstrated beyond all doubt the sinister policy of Russia, and was the chief cause of the hatred with which the northern Power was regarded. In England the bombardment passed almost unnoticed, as it occurred simultaneously with the disaster to the "Titanic," which entirely absorbed public attention.

Persia in 1913.—The year before the outbreak of the World War found Persia in a miserable plight. Russia was constantly strengthening her hold on the N. by seizing on, or creating, pretexts for further intervention. Great Britain was bound by the Anglo-Russian Agreement to coöperate with the northern Power, but did her best to help Persia to maintain her independence, a task which native incapacity, intrigue and corruption rendered very difficult. In her sphere of influence in the S. she supported the organization and development of the Swedish gendarmerie by advances of money and by other means, and tried to secure capable governors for Fars and Kerman. The position in Fars, the storm-centre of southern Persia, remained thoroughly unsatisfactory. The Kashgai tribe, the most powerful in southern Persia, defied the governor-general and raided in Fars as did the Boir Ahmadi; the Khamsch Arabs raided the caravan routes in the Kerman province; and other tribes raided in the Fars, Yazd or Kerman provinces from time to time. It was generally realized that the evil was beyond the powers of the Persian Government to cure, but in pursuance of the British determination to avoid any increase of commitments—a decision that was eminently sound—action in the form of unsatisfactory palliatives was alone taken. Throughout this period, no Persian Cabinet would assume office without applying for a considerable advance of money from the two Powers. Money was given, the question of repayment was arranged, and there were practically no results. Much of the money was embezzled and the balance was spent to small advantage. The case of Capt. Eckford, who was killed by a raiding party of Boir Ahmadi tribesmen between Shiraz and Dasht-i-Arjan, is typical. The governor-general of Fars, Mukhlir es Sultaneh, who played a sinister rôle in the World War, took advantage of the incident to press for large sums of money, with which he proposed to raise a force of over 1,000 men, and expressed his confidence that he would be able to punish the Boir Ahmadi and other evil-doers without difficulty. The Swedish gendarmerie was already being organized in the province, but had the fatal defect from the point of view of a Persian governor-general that the money for their pay did not pass through his hands. At Teheran the Treasury was empty. A Cabinet bent on reform was being constituted with a programme which entailed a loan of about £5,500,000. Meanwhile, in order to support the governor-general of Fars in his unsuccessful attempts to restore order and punish the Boir Ahmadi, the British legation advanced a sum of £15,000 for three months and, later on, £100,000 for twelve and a half months. In Feb. 1913, the two Powers advanced Persia £400,000. The negotiations for a larger loan were connected with that of railway concessions of which some account is given below.

Salar ed Dauleh.—Among the many difficulties of the Persian Government, that of Salar ed Dauleh was particularly irritating.

That troublesome prince had rebelled against his brother Mahommed 'Ali Shah, had been defeated and had been kept under honourable arrest. When Mahommed 'Ali Shah made a bid to regain the throne in 1911, Salar had, as mentioned above, organized a movement from the S.W. and proclaimed himself Shah but, again, had been decisively beaten. In 1912, the irrepressible prince reappeared on the scene and, after occupying Kurdistan, threatened Hamadan. Farman Farma, appointed governor-general of Kurdistan, held Kermanshah against him, inflicting a repulse which drove Salar to take to flight. He then proceeded to lead the life of a brigand chief, fomenting local troubles and blackmailing any wealthy landowner or merchant who was unfortunate enough to fall into his hands. After the formation of the Cabinet of 'Ala es Sultaneh in 1913, it was decided to make terms with the prince who, mainly through Russian support, was nominated governor of Gilan. The regent realized the danger of appointing this "stormy petrel" to a post where he controlled the main route between Russia and the capital, and refused to sanction the appointment. The Russian Government, for a while, declined to permit it to be cancelled, but finally at the repeated request of the British, induced Salar to accept a pension and leave Persia. During the same period there was considerable anxiety as to the movements of the ex-Shah who, it was feared, was intending to make another bid for the throne, but the enquiries made by the British Government tended to show that there was no real cause for anxiety on the subject.

The Swedish Gendarmerie.—The general condition of Persia is one of chronic anarchy which is more intense the nearer any particular locality may be to the powerful raiding tribes. This anarchy the Persian Government is impotent to stop until there is a radical change of character and a movement towards virility and honesty in the governing class. A study of the Blue Books from one point of view is a summary of outrages and of ineffectual measures taken for their punishment, the British minister making the best of an almost hopeless situation and staving off a total collapse by a hand-to-mouth policy of doles, warnings and good advice. In view of the fact that Russia had organized a Persian Cossack brigade in the N., it would have been only befitting that Great Britain should organize a force for the restoration of order in the S., but so afraid of increased commitments was the British Foreign Office that it agreed to the Persian Government engaging Swedish officers for the formation of a gendarmerie and, in the summer of 1911, a mission composed of 20 officers reached Persia under Col. Hjalmarson. The Swedes had no knowledge of the country, the Moslem people, the language or oriental intrigue. The Russians eyed their mission unfavourably and would have rejoiced at its failure. They considered that, if successful, the gendarmerie would certainly become a dangerous rival to the Cossack brigade, which was only nominally controlled by the Persian Government and was actually under the orders of the Russian legation. The Persian Cabinet, although anxious for the success of the gendarmerie, was generally apathetic and also irregular in making payments. The British legation, on the contrary, helped and supported the new force in every way, realizing that unless it succeeded in its very difficult task of restoring order, Persia might well break up into a number of robber-infested provinces. The Swedish officers who were drawn from the regular army, worked hard to train their men. At first, they enlisted the riff-raff of Teheran but gradually recruited a better class of men. Their ignorance of how to deal with Moslems led them to make many mistakes, but this was after all only natural. Generally speaking, they made good progress at the capital and in its neighbourhood.

The British legation, which was watching the dwindling of trade in Fars and the increasing lack of law and order, constantly urged the necessity for sending a force of gendarmes to that province and, in Feb. 1913, the first detachment left for Shiraz. Col. Hjalmarson's scheme for Persia was to place 1,500 men as road guards in Fars supported by a mobile column of 1,800 men. A contingent at Isfahan would form a link with headquarters at Teheran. He also intended to organize stations for the Qum-Sultanabad, for the Hamadan-Kermanshah, and the Samnan-Damghan routes. These schemes would require about 8,000 men and would bring up the number of instructors to twenty-eight. The cost would have been about £400,000 for the first year and, later on, considerably more. The problem of Fars was very difficult, owing both to the power and disposition of the Kashgais, Boir Ahmadi and other tribesmen, and the rugged nature of the terrain. The Swedes made an unfortunate start at Bushire where they enlisted 168 men locally, many of them noted bad characters. These men, owing to two of their number being stripped naked and flogged, all resigned. Probably it was fortunate that they did so, for had they escorted a caravan of arms and ammunition to Shiraz, as was the original intention, it is hardly likely that it would have reached its destination with its contents intact. The gendarmerie marched into Fars and on the way made a successful attack on some Arab robbers, recovering a certain amount of looted property. Owing to the men belonging to N. Persia it was found impossible to take over the route near the coast, as the heat overpowered them, but they occupied it as far as Kazerun. At first the newcomers were not attacked, although the petty chiefs, who lived by blackmailing caravans, realized that if they remained their profits would cease. They were however afraid to move and the gendarmerie gradually established themselves and engaged a num-

ber of tribesmen as levies. In the vicinity of Shiraz, a detachment was taken out to attack the Kashgais before it was sufficiently trained, with the result that the men behaved badly and allowed themselves to be disarmed. However, they had constructed posts along the route and these they held at the outbreak of war.

The Bakhtiari Domination.—The chief rôle in the Persian revolution had been played by the Bakhtiari tribe which, entirely owing to the influence of Sirdar-i-Assad, had marched on Teheran and secured the abdication of Mahommed 'Ali Shah. During the years that followed, not only had they held the chief posts but their tribesmen had been the mainstay of the constitution. Whenever an expedition had been sent out, they drew money, arms and ammunition, most of which ultimately reached the Bakhtiari country. Sirdar-i-Assad had undoubtedly cherished the ambition of founding a new dynasty, but while events were favouring his designs, he became blind. However, his tribe continued to dominate Teheran and assumed a provocative attitude towards the gendarmerie. The Swedish officers took prompt action, surrounded the Bakhtiari quarter with machine-guns and artillery, and put an end to an intolerable state of affairs from which Europeans as well as Persians had suffered. The chiefs, perforce, agreed to dismiss the greater part of their contingents and felt the humiliation so keenly that they never again attempted to dominate the capital.

German Activity before the World War.—For some 20 years before the war, Germany had made strenuous efforts to increase her influence and interests in Persia. Perhaps the most definite success gained at the capital was the opening of a college staffed by German professors, to which the Persian Government was induced to contribute a handsome annual grant.

But to realize the persistence with which her policy was conducted, attention must be turned to the Persian Gulf. Before 1896 Germany had no representative or trade in that torrid region but, in that year, the campaign opened by the firm of Wonnekhaus establishing itself at Lingeh where it began dealing in mother-of-pearl; and, in 1897, a German vice-consulate was founded at Bushire. Three years later Germany made great efforts to purchase a site for the terminus of the Bagdad railway at Kuwait, but the astute Sheikh Mubarak had previously concluded a secret treaty with Great Britain by the terms of which, in return for protection, he agreed not to sell or lease any of his territory without the consent of that Power. Germany did not accept this rebuff as final and induced Turkey, members of Mubarak's family, and the Wahabis to take a hand in the game, but all direct attacks were foiled by British sea-power. A more successful plan was to induce the Turks to establish posts in Khor 'Abdalla, an inlet running from behind Bubiyan Is. to within 30 m. of Basra. The fact that the creek was situated in Mubarak's territory mattered nothing, and these posts were occupied until the outbreak of the World War. Five years after its foundation at Lingeh, the firm of Wonnekhaus, supported by German subsidies, opened its headquarters on the Bahrain Is. with branches at Basra and Bandar 'Abbas. The reason for the change of headquarters was soon evident as the islands are situated among the pearl banks, of which Germany attempted to gain control through a lease derived from the Sultan, whose claims in the Persian Gulf were shadowy. The little island of Halul, which is situated in the centre of the banks, was particularly aimed at, but Great Britain intervened and spoilt the new scheme. Germany was indefatigable in her efforts. Foiled entirely as regards the pearl fisheries, she attempted to control the working of the red oxide deposits of Abu Musa. The Sheikh of Sharja, a Trucial chief, bound by treaty with Great Britain not to enter in an agreement with any other Power, had granted a concession for working these deposits to three Arabs, two of whom lived at Lingeh, while the third partner was his own subject. Wonnekhaus acquired the concession which the Sheikh promptly cancelled, sending a large body of his subjects to expel the concessionaires. This action raised a storm in the German press, but the case was too weak to be supported and merely a formal protest was made. The last attempt to be recorded was to secure a large piece of land along the river bank at Mohammerah, with the object of creating a German settlement, quays, etc., but again British vigilance was too strong. Much credit is due to Sir Percy Cox, the British Resident, for foiling every German attempt. In spite of these failures, in 1906 the Hamburg-America Co. started a service to the Persian Gulf. The first steamer created a sensation, lavish hospitality being dispensed to all comers, who also welcomed the novelty of a band. Trade was small at first and native passengers were not encouraged, but shipments of railway material helped matters and ultimately a flourishing trade was established. Great Britain, at the actual outbreak of war, was engaged in negotiations with Germany and Turkey. So far as the former Power was concerned, but for the war she would have secured a strong position at Basra, the destined terminus of the Bagdad railway. The suzerainty of Turkey over Kuwait was also acknowledged. In other words British predominance in the Persian Gulf would have been weakened. So far as this important problem was concerned, the results of the war have been beneficial.

Persia at the Outbreak of the World War.—The regent left Persia for more than a year in 1912, merely returning to arrange the coronation of the young Shah. This took place with due pomp

and circumstance in July 1914 and, as Nasir el Mulk left Persia again after the ceremony, the young monarch had hardly taken up his duties when the war broke out. His Majesty summoned the Majlis and duly proclaimed the strict neutrality of Persia. The position was, however, very difficult. The grandees were, in many cases, only anxious to receive money from one or more sides; the masses hated the Russians and disliked and mistrusted the British for being friends of their enemies. There was sympathy in some quarters for the Turks and "let the Christians devour one another" was frequently heard. But the outstanding feature was the powerlessness of Persia. Her military forces included the Cossack brigade 8,000 strong, the Swedish gendarmerie 7,000 strong, and the useless Persian troops under Persian officers.

At first sight it would seem unlikely that remote Persia should become a war theatre, but actually this was bound to be the case, unless she could defend her neutrality. A reference to the map will show that Azerbaijan, the N.W. province of Persia, marches with Turkey on the W. and with Russia to the N. Furthermore an advance by either belligerent through Persian territory would enable that Power to outflank the other and operate in open country, whereas a direct attack could only be made across the very high range which runs from the shores of the Black Sea to Mount Ararat. This strategical fact had been realized by Russia and Turkey before the outbreak of the World War, and both Powers, taking advantage of the impotence of Persia, had established themselves in Persian territory in the vicinity of Lake Urmia, the Turks holding the chief passes on the Perso-Turkish frontier which was only finally delimited just before war began.

Russo-Turkish Operations in Azerbaijan.—At the outbreak of hostilities the Russians, in this section of the war theatre, assumed the offensive and drove the Turks back on Van. However, the Kurds on both sides of the frontier rallied to the Turks and, finding Tabriz undefended, entered it in Jan. 1915. They then moved northwards along the road to Julfa, only to be repulsed by a Russian detachment which subsequently reoccupied Tabriz. At Urmia the Kurds, driving in front of them the Christian tribesmen of Targavar, assaulted the town, hoping to massacre its Christian inhabitants. But, aided by a small Russian detachment and the tribesmen of Targavar, the townspeople drove off the enemy. The Russians, in view of the Turkish invasion of the Kars province, were obliged to draw in their outlying detachments, and this was followed by the exodus of 10,000 Christians.

In the spring of 1915, after the crushing defeat of the Turks at Sarikamish, the Russians reoccupied Urmia and advanced to Van. They were joined by the Assyrian Christians of Kurdistan, who, when left alone to bear the brunt, actually migrated with their families and flocks to the neighbourhood of Urmia, whence they raided their enemies the Kurds and generally did good service to the Russians, until the disintegration of the Russian army.

Operations in S.W. Persia.—Before war was declared by Turkey, the Government of India took the wise precaution of despatching a brigade of Indian troops to the Bahrain Islands. At the outbreak of hostilities, this force pushed up the Shatt al 'Arab to protect the important refineries of the Anglo-Persian Oil Co. on the island of Abadan. This brigade was rapidly increased to a division which, after defeating the Turks at Sahil, a few miles above the oil refineries, occupied Basra on Nov. 23. The occupation of Basra effectually protected the oil refineries, but these works in their turn depended on the oil-fields at Maidan-i-Naftun and the vulnerable pipe-line which was laid through Ahwaz and was 150 m. in length. The neighbouring tribesmen, partly through propaganda and partly through fanaticism, had breached and fired the pipe-line in several places. The Bakhtiari tribe, with which the British had maintained friendly relations for many years and which owned the ground on which the oil-wells were being worked, was generally hostile, the arrangement sometimes being that the fathers professed pro-British sympathies while the sons were fighting for the enemy. To protect the pipe-line a brigade was despatched to Ahwaz, where it was faced by a considerable number of Turks supported by thousands of tribes. A reconnaissance in force found the enemy much stronger than was expected and was obliged to retreat with heavy loss.

the enemy showed no inclination to attack the main body of the British who, for some time, maintained a defensive attitude. In the spring, Maj.-Gen. Sir G. Gorringe was ordered to attack the Turks with the 12th division. The enemy retreated and Gorringe, after dealing with the hostile Beni Tauf, drove them back on Amara, which had meanwhile been captured by Maj.-Gen. Sir Charles Townshend. As a result of these operations, Persian soil was cleared of the enemy, the local tribes made their submission, the pipe-line was repaired, and the valuable oil again flowed along it.

German Activity in Persia.—It is interesting to study the policy of Germany in the Middle East after the outbreak of the World War. Its object was to embarrass Russia and, still more, Great Britain, by forcing Persia and Afghanistan into the war on their side, and by creating disturbances on the frontiers of India and inside India. The scheme was sound, for, if Persia alone had declared for the Central Powers, the claim that Islam was on their side might have brought in Afghanistan. As it was, with comparatively small forces and at a relatively small cost, Germany certainly drew forces to Persia, which would otherwise have been available for other fronts. Had it been possible to march a Turkish brigade across Persia to Afghanistan, the Amir would probably have been obliged to join in an invasion of India or would have been killed. India at that time was weakly held, while the "Emden" had cut her sea communications. In the many arguments shown for and against the advance on Baghdad, this important question is apt to be neglected.

The plan of operations in Persia was two-fold. Agents well-furnished with arms and money were sent to enlist levies and to march across central and southern Persia, murdering British and Russian officials, and plundering and driving out the small English colonies. These groups were to form supports to missions destined for Afghanistan and Baluchistan. These latter bore letters on vellum written to the address of the Amir of Afghanistan and the ruling princes of India, and signed by the German Foreign Secretary. They also had various German decorations for distribution. They carried on a propaganda which was anti-Christian, giving out that the Kaiser and his people had become converts to Islam and that the former was now known as *Hajji Wilhelm*. The most successful German agent and the earliest in the field was Wassmuss, who before the war was consul at Bushire. He succeeded in organizing a strong anti-British confederacy in Tangistan, Dashti and Dashtistan, although there was also a pro-British party in these districts. The attacks on Bushire forced the British to increase the small number of troops that normally sufficed to guard the important wireless installation and the cable. Its defence suffered from the fact that the cable station was at Reshire, six m. distant, while the residency and other houses occupied by the British covered a large area outside the town. The Tangistanis made several daring raids, in one of which two British officers were killed. The strongly anti-British attitude of the Persian Government, which made no effort to protect the British colony, resulted in the temporary occupation of Bushire by the British, a step that afforded German propaganda a real chance that was fully exploited. Generally speaking, the activity of Wassmuss detained troops at Bushire, which were sorely needed elsewhere. In Fars, too, Wassmuss was equally successful. He found Mukhbir es Sultaneh, the governor-general, strongly pro-German owing to his education at Berlin. He also found the Swedish officers of the gendarmerie equally friendly and, through their instrumentality, he won over that force to his side. As a result, in the autumn, the British vice-consul was murdered and, shortly afterwards, the consul and the entire colony were arrested and taken to the coast, the men being held prisoners by the Tangistanis, while the women were sent to Bushire. Qawam el Mulk, chief of the Khamseh Arabs, who was acting governor-general, was driven out and retired to Lingeh, thus leaving the German consul supreme in Fars.

The main route by which German parties entered Persia from Bagdad was through Kermanshah and Hamadan. In April 1915, the Turks advanced on Kermanshah with a force mainly composed of levies which expelled the British colony. The German consul at Kermanshah engaged levies and carried on a vigorous propaganda; he also drove back the British and Russian consuls when they sought to return under Persian escort. At Isfahan, Pugin, dressed as a Persian, with the profession of Islam on his lips, persuaded the credulous citizens and their religious leaders that the Kaiser was indeed a *hajji* or pilgrim to Mecca. Assassination was deliberately employed. First the Russian vice-consul was murdered and, later, the British consul-general was wounded and his Indian orderly killed. A letter from a German official, Seiler, was subsequently intercepted, in which he gloried in having arranged this cowardly stroke. Farther E. at Yazd, enemy parties looted the treasury of the Imperial Bank of Persia, a British company, and drove out the colony; and, at Kerman, similar action was taken, together with the assassination of a prominent British subject. At the end of 1915, even out of the seventeen branches of the Imperial Bank were in enemy hands and the British colonies had been expelled from central and southern Persia. Only the Gulf ports remained safe, thanks to their sea-power and garrisons.

In the N. the position was very different. Owing to the danger to which the Allied legations were exposed, Russian troops had landed at Enzeli in May and had marched to Kazvin whence, as the situation grew more menacing, they had advanced to the Karaj river, some 25 m. W. of Teheran. This movement produced a crisis. The enemy ministers perforce had to leave Teheran and, as the Persian Foreign Minister was on their side, they felt sure of persuading the young Shah to follow them. Indeed, the dilemma of Sultan Ahmad was painful. On the one side, the enemy ministers warned him that Teheran would be stormed by the Russians, who would seize and probably kill him; on the other side the British and Russian representatives pointed out to His Majesty that if he left the capital and broke his neutrality by joining the ministers of the Central Powers, he might lose his throne. Finally the Shah decided to remain at Teheran. The enemy ministers retired to Qum, where they employed their forces in somewhat aimless raiding. This was soon stopped by Russian columns, and, before the end of the year, Russian troops had occupied Kashan and were threatening Isfahan.

German Mission to Afghanistan.—One of the dangers to be guarded against was that of German missions to Afghanistan and Baluchistan. Efforts were made to intercept such parties, but it took time to make the necessary arrangements, and it was not until 1916 that the eastern Persian cordon was in working order with the Russians patrolling the frontier as far S. as Kain, from which centre the British, with some regular troops and a number of locally raised levies, were responsible to the borders of Baluchistan. Persia being a land of vast distances, it is not surprising that a German mission was able, by means of very long marches, to reach Herat in safety. It was received with every honour, but displayed extraordinary lack of tact by openly decrying everything of Afghan manufacture, the arms manufactured at the arsenal at the capital, for instance, being criticized contemptuously. At Kabul too, the same behaviour brought the mission into trouble. The Amir, who had received it courteously, delayed matters by summoning a council representative of all the tribes and by lengthy meetings with the mission and his own advisers. The Germans gradually realized that, without a Turkish force, their efforts were wasted. They were finally dismissed, the Amir pointing out that he could hardly break with the Government of India until a large, well-equipped army reached Kabul from the west. The mission broke up into small parties, most of which successfully evaded the cordon. Other missions travelling farther S., including one to Bahram, Khan of Bampur, had no success whatever, the greedy Baluch in the last-named case stripping the enemy agents who were glad to escape with their lives.

Russo-Turkish Struggle in Western Persia.—In 1916 the ebb and flow of the struggle were very marked in western Persia. At first the Turks, shortly after the retreat of the British from Ctesiphon, occupied Kermanshah and pushed forward towards Hamadan. The Russians in their turn, justly elated at their astounding feat of arms at Erzerum, advanced and drove the enemy off the plateau, while a second force swept the hostile Bakhtiariis out of Isfahan and brought back the British and Russian communities. The capture of Kut again transformed the military situation and, in the summer, the Turks, 16,000 strong with 54 guns, gradually drove back the Russians who could only oppose them with 12,000 men and 19 guns. Kermanshah was evacuated and then Hamadan, the retreat continuing as far as the Sultan Bulak range which covered Kazvin and threatened a force marching on Teheran. This situation remained unchanged until the end of the year.

Raising the South Persia Rifles.—In 1916, it was decided, in consultation with the Persian Government, to organize a force of Persian troops to restore order in southern Persia and take the place of the Swedish gendarmerie. This force was to be 11,000 strong and the Cossack brigade was to be raised to a similar strength. Brig.-Gen. Sir Percy Sykes, who had spent many years in S. Persia, was appointed to undertake this task and landed at Bandar 'Abbas in March, with three other British officers and a few Indian instructors. The state of affairs was most unfavourable as, apart from the defeat of Qawam, the British agent and his escort were assassinated at Lingeh and two British officers were assassinated in Makran about the same time, both murders being due to German instigation; and finally this terrible month of April saw the grave disaster of Kut al Amara. Many experienced men expected a wave of fanaticism to sweep across Persia and there was certainly cause for deep anxiety, especially in Makran, but British coolness undoubtedly saved the situation. Recruiting operations at Bandar 'Abbas were started immediately after landing and, in spite of a strong anti-British party, men were rapidly enlisted and, before the end of a month, the Persian flag was hoisted with ceremony over a camp. The force, handled with much tact and patience by its British and Indian instruc-

tors, never looked back and was soon able to protect Bandar 'Abbas and an important section of the caravan route from the raiding tribesmen.

The Success of Qawam el Mulk and his Sudden Death.—Qawam was aided by the British with money and munitions, and an exaggerated report of the means placed at his disposal led to the rebel Arab headmen kissing his feet. With their aid he defeated the Swedish gendarmerie, and was marching in triumph to Shiraz when he was killed by a fall from his horse. His son, a man of 28, was however able to restore Persian authority in Fars.

The March of Sir Percy Sykes to Kerman.—The success of Qawam and the landing of the mission at Bandar 'Abbas made the position of the German parties at Kerman decidedly insecure. The governor-general became hostile to them and they decided to retire westwards to Fars, the route farther N. being dangerous owing to the Russian advance southwards. They fled in two parties, and after suffering some losses from attacks on the road, were all captured by Qawam and imprisoned at Shiraz to the number of 60 Germans and Austrians, a dozen Turks and a few Afghans. A small force of Indian troops, consisting of a section of mountain guns, a squadron of cavalry and 500 rifles, was sent to Bandar 'Abbas and Sir Percy Sykes marched inland a distance of 280 m. to Kerman, where he was received with much cordiality. The various pro-German elements who had created a state of insecurity fled, the bank and telegraph offices were reopened, and the normal state of affairs was very quickly reestablished. At Kerman, recruiting for a brigade of the S. Persia Rifles was started with much success, and, before long, it was dealing effectively with the robber bands which were destroying life and property in the province. The column, after halting for some weeks, marched on to Yazd, where the British colony had only recently returned. News being received of the Turkish advance and of a probable attack on Isfahan, the column, instead of marching direct to Shiraz as originally intended, proceeded to Isfahan and joined the force of 600 Russian Cossacks at the ancient capital of Persia. The Turkish force had reached Dunbeni, 60 m. to the N.W. of Isfahan, but had not advanced any further, and it appeared that exaggerated rumours as to the size of Sir Percy Sykes's force had been the cause of this change of plan. During the halt at Isfahan, the column marched out for 50 m. along the Ahwaz route, attacked Jafar Kuli, a noted brigand, who was holding it, and provided an escort for loads of British merchandise that had been lying at Kava Rukh for many months. Altogether 16,000 loads were brought in, and incidentally several merchants were saved from bankruptcy. When it finally became evident that the Turks would not advance on Isfahan, the column marched S. to Shiraz, which it reached in Nov., thereby completing a march of 1,000 m. through the heart of Persia.

Taking over the Swedish Gendarmerie in Fars.—At Shiraz the question of the gendarmerie had to be settled. The Persian Government had not actually given its consent to it being incorporated in the S. Persia Rifles, but was unable to pay or equip the force. Spread over the route for a distance of 300 m. from the borders of Fars in the N. to Kazerun in the S. and numbering some 3,000 men, the problem which confronted Sir Percy Sykes was one of extreme difficulty. He had no staff to administer or train such large numbers and he was aware that it was this force which had seized the British consul only a year previously and that many of the officers were pro-German in sentiment. But he also realized that, if the gendarmerie broke up into well-armed bands of robbers and devastated the country, few supplies would reach Shiraz. He consequently addressed the officers, explained to them that they were to be absorbed into the S. Persia Rifles, and expressed the hope that they would serve Persia loyally by helping to put down the brigandage that was slowly but surely extirpating the sedentary population. In March 1917, this action was indirectly approved by the Persian Government, which officially recognized the S. Persia Rifles. The men were in rags, half-starved and undisciplined. It was impossible to take them off the road immediately, as there were no barracks for them at Shiraz. It was a case of feeding, clothing and paying the men at first and of gradually restoring the discipline that appeared to be almost lost. With only three or four British officers available, much was done, and when a proper staff reached Shiraz in the spring of 1917, rapid progress was the order of the day.

The Restoration of Order in Southern Persia.—Since the assassination of Nasir ed Din in 1896, the authority of the Persian

Government had weakened year by year, and in Fars the governor-general had been at the mercy of the powerful Kashgai tribe. Under their capable chief, Solat ed Dauleh, these powerful nomads numbering 130,000 tribesmen, and moving in their migrations from the Persian Gulf to Qumisheh, dominated the province, of which Solah (Solat) was the "uncrowned king." They were armed with Mausers, had plenty of ammunition and displayed great bravery in the field. Solah collected the revenue in full from his tribesmen, but paid nothing to the Persian Government. He also sent powerful raiding parties throughout the greater part of the province, which looted and levied blackmail. If a governor-general attempted any opposition to Solah, the latter promptly prevented supplies and goods from reaching Shiraz. The result was scarcity in the bazaars and discontent, followed by riots, and the governor-general returned to Teheran. It was obvious that Solah would be hostile to the British. The Kashgais considered that raiding was their right and would combine against anyone who attempted to put an end to it. Generally speaking, they held western Fars at their mercy and, farther E., lay the territory of the Khamsch Arabs, who were 70,000 strong. Under their chief, Qawam el Mulk, they ranged from the neighbourhood of Bandar 'Abbas and Lar to the vicinity of Niriz and Dehbid. The Arabs were less well-armed than the Kashgais but were equally brave. They were also equally addicted to looting. The marked difference between the two chiefs was that Qawam was a polished Shirazi, anxious to improve the state of Fars, although he could not immediately stop looting, whereas Solah lived with his tribesmen all the year round and had the same mentality. Sir Percy Sykes met Solah, with whom an agreement was made to prevent his tribesmen from looting, and, although it was realized that he was thoroughly untrustworthy, he refrained from attacking the British during 1917, and allowed them time to open up communications and construct forts at Saidabad (Sirjan) and Niriz. With Qawam good relations were maintained throughout.

In the summer of 1917, a force of Indian troops was stationed at Dehbid which, by the infliction of a single salutary punishment, made the main route safe, and caravans once again began to pass. In the autumn, combined operations against tribes marked down for punishment were undertaken by the Fars and Kerman columns. So successful were they that, had there been no interruption, S. Persia would have rapidly settled down to comparative prosperity. But the reaction of the World War was destined to be felt still more strongly than before in remote Fars.

Successful Russian Campaign in Western Persia.—The saddest year in Russian history opened with military success in Persia. As already mentioned, at the end of 1916, the Turks were occupying Hamadan and facing the Russians at Kazvin. During the winter, however, the position in Mesopotamia entirely changed. Instead of weak, ill-equipped columns, severely handicapped by unfavourable climatic conditions, failing before Kut al Amara, there was the pleasant picture of overwhelming forces under the inspiring leadership of Gen. Sir Stanley Maude recapturing Kut in Feb. 1917 and following this up by the signal success of the surrender of Bagdad to the British. The position of the Turks in Persia became more and more difficult as the British advanced. On the day Bagdad was occupied they evacuated Kermanshah and, pursued by the Russians, reached the Persian frontier at Qasr-i-Shirin on March 31, worn out and hungry but not wholly demoralized. Meanwhile the British had despatched two brigades to the Jebel Hamrin, but found the range occupied in great force by the Turkish 18th corps, which did not retire until the 13th corps had evacuated Persian soil intact, when the united forces moved northwards. On April 2, a squadron of Cossacks met the British at Qizil Ribat, but marched back the same night. There was no question of maintaining contact, but the British helped their allies to establish themselves firmly on the Diála river.

The Russian Collapse in Persia and its Results.—March 1917, which witnessed the capture of Bagdad, also saw the abdication of the Tsar. Gradually the Russian troops in Persia became demoralized and, during the winter of 1917-8, the rot had set in. Hordes of Russians made for home, plundering the villages for food, pulling down houses to secure timber for fuel and

arms, ammunition and equipment for a meal. Horses went for a few shillings, but this movement had completed the denudation of western Persia, already suffering from serious scarcity of forage, so that there were few buyers. Briefly, famine conditions prevailed in W. and N.W. Persia, and indeed in the other provinces. Such was the local position, but the world-results were still more serious. While Russia was fighting on the side of the Allies, her army stretched southwards from the European front across the Caucasus and N.W. Persia until, as we have seen, its extreme left flank, in 1917, touched the right flank of the British army in Mesopotamia, and thereby effectually prevented our enemies from approaching the frontiers of India. The ambitions of Germany to reach the Persian Gulf and India by that potent instrument, the Bagdad railway, had been rendered nugatory by the capture of Basra, but the collapse of Russia opened up a completed line of northern advance across the Caucasus and the Caspian Sea to 'Ashqabad, Merv (the junction for Kushk, within striking distance of Herat), Bukhara, Samarkand, and Tashkent, the administrative centre of Russian Turkestan. Over 100,000 German and Austrian prisoners were in Central Asia and, when through communication had been established, it would have been easy to reorganize these veterans and march on Kabul, with an invitation to the Afghans to share in the plunder of India.

When the Russian Empire proved to all the world its utter rottenness, Georgia and Armenia decided to claim their independence, and a third state came into being under the title of the republic of Azerbaijan, with Baku as its capital. In connexion with efforts made to ward off this terrible threat to India, British troops entered western Persia.

The Dunsterville Mission.—It was out of the question to dispatch large bodies of troops to support the Georgians or Armenians, as Bagdad was 800 m. distant from Baku. The authorities therefore decided to dispatch a military mission to reorganize the sound elements of the country into a force that would prevent the Turks and their German masters from reaching Baku. It was hoped that these small states would fight for their homes, but the Armenians absolutely failed to do this. Maj.-Gen. L. C. Dunsterville was appointed to command this mission, and, in Feb. 1918, he started off from Bagdad with a party of officers in 40 cars to cross N.W. Persia. Enzeli was his objective, and he hoped from that port to be able to proceed to Baku and Tiflis. He reached Enzeli only to find that the port and its shipping were in the hands of hostile Bolsheviks, while the neighbourhood was dominated by Mirza Kuchik Khan, an ambitious brigand who had recruited some 4,000 followers, nicknamed *Jangalis* or "Forest Dwellers," to the cry of "Persia for the Persians" and who robbed his countrymen if they refused to join him. Dunsterville quickly realized the situation, and, before his opponents had concerted their plans and had overcome their fear of the armoured motor-car, the mission had retired to Kazvin and Hamadan, which latter city became its headquarters. During this period, Dunsterville was brought into close relations with the Russian generals Baratov and Bicherakov. The former had commanded the Russian troops in northern Persia and was now helplessly watching their disintegration. The latter, on the contrary, had kept his command of 1,200 men practically intact. By March, the last of Baratov's men had left, but Dunsterville had been able to keep Bicherakov's command at his side. Without its aid, the *Jangalis*, elated by the retirement of the mission which was magnified into a great victory over a British army, would have been able to march on the capital. There they would probably have introduced a reign of anarchy and have forced Persia into the war on the side of the Central Powers, with whom Kuchik Khan had close relations, and also German, Austrian and Turkish instructors, well supplied with machine-guns. When the *Jangalis* marched on Kazvin, Bicherakov forestalled them and drove them back to the forests with heavy losses. He then embarked at Enzeli. Dunsterville, who had received reinforcements consisting of a regiment of cavalry, a battery and two regiments of infantry, followed behind Bicherakov and took over the road. The *Jangalis*, under their European officers, attacked a detachment of British troops, but suffered heavy losses, and Kuchik Khan made

terms and became a contractor for supplies. About this time, the Bolshevik Government at Baku was overthrown and replaced by the Central-Caspian Dictatorship, which asked for British assistance. Dunsterville took his force to Baku, held it for some weeks against overwhelming Turkish numbers, denying the use of the oil wells to the enemy, whom he also kept away from the Caspian Sea, and finally evacuated the town and returned to Enzeli, thus ending a very gallant episode of the war.

During the early autumn of 1918, more troops were moved up into N.W. Persia to prevent the threatened Turkish advance from Azerbaijan, the plan being to hold the Sehneh Bijar-Zenjan-Enzeli line. Actually the threat came to nothing, but a brigade of British troops was kept at Kazvin to protect Persia against the Bolsheviks and to prevent the main route into Persia being closed. In March 1921, it was under orders to withdraw.

The Flight of the Assyrian Christians from Urmia.—Among the picturesque incidents of the World War, the rallying of the Assyrian Christians to the Russians, their migration to Urmia and their determined bravery in the face of enemies threatening to overwhelm them, have already been described. In the summer of 1918, an attempt was made by the British to help them with munitions and money, and a party of the refugees broke through the weak Turkish lines to receive the proffered aid. Unfortunately, false rumours of a disaster reached the main body of tribesmen who, collecting their families and flocks, fled panic-stricken to Bijar, pursued by Persians, Turks and Kurds. Every effort was made by the British to aid the refugees, but many fell on the road, by the sword and from hunger and fatigue, before the tribe, reduced to half its original number, was in safety. This flight eclipsed in dramatic interest that of the Torgut Mongols, so vividly described by De Quincey.

Military Mission of Maj.-Gen. Sir Wilfrid Maleson.—Not content with trying to head off the Turks at Baku, a second mission was despatched along the newly completed Nushki-Duzdab railway and then through Seistan and Meshed to Transcaspiia to support the Turkoman and Russians who, under the title of Mensheviks, were attempting to stem the flood of Bolshevism. Eastern Persia constituted part of the lines of communication of the mission, and there were no hostilities with the inhabitants, who, on the contrary, appeared to have realized the advantages of having a good route opened up through their country by a force which paid fair prices for everything it bought. Many gallant deeds were done by the small British detachments fighting along the Central Asian railway, and also by the force under Commodore D. T. Norris who, operating from Krasnovodsk, drove the Bolshevik flag off the Caspian Sea.

The Investment of Shiraz by the Kashgais.—In the spring of 1918, the Persian Government, in reply to a British note, denounced the S. Persia Rifles as a foreign force and a threat to Persian independence and integrity. It also expressed the hope that the British Government would withdraw its troops and allow Persia to commence her cherished reforms. Characteristically enough, while denouncing the conditions, it readily accepted the proffered financial help. The Cabinet was under the impression that Germany was winning the World War or else such a curt note would have never been penned. This reply was published all over southern Persia to the discouragement of our friends and the elation of our enemies. The results were speedily shown in serious desertions from the S. Persia Rifles and culminated in the formation of a confederacy under the Kashgai chief to annihilate the British in southern Persia. The date of an attack on the Indian troops at Shiraz was fixed by the grazing which would allow the nomads to keep their flocks in the neighbourhood, and, as there was a month to spare, Sir Percy Sykes despatched a column to deal with some raiding tribes in the vicinity of Niriz, which were known to have joined the Kashgai confederacy. These operations were successful and the small Indian detachment at Niriz was unmolested when the storm broke.

The day the column returned to Shiraz, Solah wrote that, by the orders of the Persian Government, he was about to take action for the defence of Islam against the "unauthorized force" of the S. Persia Rifles. He had at his disposal 4,500 Kashgais and 1,500 Kazerunis and this number was reinforced by contingents from Dashti, Dashtistan and elsewhere, and reached about 8,000 fighting men. The tribesmen were well armed with Mausers, had plenty of ammunition, and fought both bravely and

cunningly. The British force at Shiraz was 2,200 strong, one-third being recruits. The S. Persia Rifles slightly outnumbered the Indian troops and, owing to propaganda and the proclaimed hostility of the Persian Government, were a danger to the British. The detachments in the outposts mutinied and surrendered or deserted. Qawam had collected 2,000 Arabs in and about Shiraz, who were ready to attack the beaten side. On May 24, the day after the return of the column, it marched out under Col. E. F. Orton, 1,600 strong, and attacked the Kashgais in the hilly country to the W. of the city. The resistance of the enemy was obstinate, but the Indian troops gradually moved forward, defeating rush after rush and, after 14 hours' fighting, occupied Solah's camp on the bank of the Qara Aghach river. The Kashgais fled headlong at the end of the action, in which they had suffered some 700 casualties, as against 51 in the British column. About ten days later the enemy returned in still larger numbers, and the Kazerunis occupied the garden quarter, which almost touched the fortified perimeter constructed by the British outside Shiraz. In June, the investment became closer, as the British withdrew an outpost which was dangerously isolated. The inhabitants of Shiraz were incited against the British by the *mullas*, some of whom preached *Jihad* or Holy War. Sir Percy Sykes learned that the Kashgais were preparing to unite with the townspeople in a combined attack on June 17, and he determined to forestall them. Accordingly, on June 16, the column sallied out for 4 m. and then slowly retired drawing the Kashgais down on to the plain where they offered good targets to the guns. The column then returned to Shiraz. On the following day, Shiraz rose, its inhabitants attacking everyone suspected of being friendly to the British. But the Kashgais, whose losses had again been heavy, did not come to the support of the townspeople, who were overawed by the seizure at midnight of various key-positions by the British. The tide then turned. The governor-general appointed a new *Ilkhani* or "paramount chief" in place of Solah, whose followers began to break away, influenced by the heavy losses they had suffered. Qawam declared in favour of the new *Ilkhani*, and his example was followed by a brother of Solah who was followed by perhaps one-quarter of the tribe. The column marched out again, and Solah fled a broken man, pursued by Qawam, the new *Ilkhani*, and most of the Kashgai tribe.

The Siege and Relief of Abadeh.—Meanwhile the S. Persia Rifles at Abadeh, a town situated between Shiraz and Isfahan, had mutinied. The British officers took refuge with a company of 16th Rajputs, who held the small fort against overwhelming numbers. Within 36 hours of the final defeat of Solah, the victorious column marched northwards and, after a forced march of 180 m. in 169 hours, relieved Abadeh.

The Final Defeat of the Kashgais, Oct. 1918.—The new *Ilkhani* had no easy task in establishing his position and was besieged in his fort by the fickle tribesmen, who changed sides whenever it appeared to be to their interest to do so. The column rapidly marched S. and gave the Kashgais a final overthrow, the Burma Mounted Rifles counting 103 corpses. Solah fled weeping, and has been a refugee ever since. The night after this final success, both victors and vanquished were prostrated by the deadly influenza epidemic. The losses were appalling, 18% of the Shiraz force dying. The inhabitants of the city lost even more heavily. Indeed, the country generally suffered terribly, the scourge carrying off the young and able-bodied and sparing the old.

The Opening of the Bushire-Shiraz Route.—When Sir Percy Sykes was invested at Shiraz, the small force of Indian troops at Bushire was strengthened and arrangements were made for organizing a base with a view to an advance in October. In the autumn, influenza broke out, but the type was fortunately mild, the losses being only 2%. The force engaged in opening up the road included no fewer than 20,000 fighting men and followers and, as there was no fear of serious opposition after the final defeat of Solah, the operation was mainly one of constructing a good camel track up the infamous passes and of feeding the force. A railway was laid to Borazjan, 37 m. distant, across the level plain and thence carts plied to the foot of the passes. Kazerun was finally reached on Jan. 27 1919, the Shiraz column coöperating by marching over the passes to within a few miles of that town. The beneficent activity of the British was continued, and, when the troops withdrew in the spring of 1919, a good track, over which a car could run, albeit with great difficulty in

a few places, had been constructed from Bushire to Shiraz. Unfortunately this route will require constant repair to keep it in good order, and it is unlikely that the Persian Government will do this. The result of these operations was entirely beneficent to the Persian Government. The Kashgais, who had had each successive governor-general at their mercy, were cowed and dispirited and it would have been easy to control S. Persia. But the Persian Government, as at present constituted, cannot maintain law and order.

Persian Delegation to the Peace Conference.—In 1919, a Persian delegation reached Paris in order to lay its claims before the Peace Conference. These claims were divided into three parts, dealing respectively: (a) with political, juridical and economic independence; (b) with right to territorial restorations; and (c) with right to reparations. Heading part (a) was the Anglo-Russian agreement of 1907, the abrogation of which was rightly demanded and was conceded so far as concerned Great Britain. Other demands, such as the abolition of consular courts and the withdrawal of consular guards, are entirely out of the question until Persia sets her own house in order and can guarantee order, security, and a pure administration. The territorial claims were extravagant, including Transcaspiia, Merv and Khiva to the E., the Caucasus as far N. as Derbent and, westwards, Kurdistan, Diarbekr and Mosul. The claims for reparation stood on a different footing, as the W. and N.W. provinces of Persia undoubtedly suffered terribly from the ebb and flow of the contending armies, the retreat of the demoralized Russians and the flight of the Assyrian Christians. It is to be regretted that the delegation could not be permitted to lay its case before the Peace Conference, even though its claims were extravagant. Actually the Cabinet, which had despatched the delegation, fell and a representative of the new Cabinet laid the case of Persia before the Supreme Council.

The Anglo-Persian Agreement 1919.—In the summer, after negotiations extending over a period of nine months, two Agreements were signed at Teheran, the first of which was as follows:—

PREAMBLE: In virtue of the close ties of friendship which have existed between the two Governments in the past, and in the conviction that it is in the essential and mutual interests of both in future that these ties should be cemented, and that the progress and prosperity of Persia should be promoted to the utmost, it is hereby agreed between the Persian Government on the one hand, and His Britannic Majesty's Minister acting on behalf of his Government on the other, as follows:—

1. The British Government reiterate, in the most categorical manner, the undertakings which they have repeatedly given in the past to respect absolutely the independence and integrity of Persia.
2. The British Government will supply, at the cost of the Persian Government, the services of whatever expert advisers may, after consultation between the two Governments, be considered necessary for the several departments of the Persian Administration. These advisers shall be engaged on contracts and endowed with adequate powers, the nature of which shall be the matter of agreement between the Persian Government and the advisers.
3. The British Government will supply, at the cost of the Persian Government, such officers and such munitions and equipment of modern type as may be adjudged necessary by a joint commission of military experts, British and Persian, which shall assemble forthwith for the purpose of estimating the needs of Persia in respect of the formation of a uniform force which the Persian Government proposes to create for the establishment and preservation of order in the country and on its frontiers.
4. For the purpose of financing the reforms indicated in clauses 2 and 3 of this agreement, the British Government offer to provide or arrange a substantial loan for the Persian Government, for which adequate security shall be sought by the two Governments in consultation in the revenues of the Customs or other sources of income at the disposal of the Persian Government. Pending the completion of negotiations for such a loan the British Government will supply such funds as may be necessary for initiating the said reforms.
5. The British Government, fully recognizing the urgent need which exists for the improvement of communications in Persia, with a view both to the extension of trade and the prevention of famine, are prepared to coöperate with the Persian Government for the encouragement of Anglo-Persian enterprise in this direction, but by means of railway construction and other forms of transport subject always to the examination of the problems by experts and to agreement between the two Governments as to the particular projects which may be most necessary, practicable and profitable.
6. The two Governments agree to the appointment forthwith of a joint Committee of experts for the examination and revision of the existing Customs Tariff with a view to its reconstruction on a basis calculated to accord with the legitimate interests of the country and to promote its prosperity.

Signed at Teheran, August 9, 1919.

The second Agreement defined the loan, which was fixed at £2,000,000 at 7%, redeemable in 20 years. There were two letters, in the first of which the British Government promised co-operation in securing a revision of the treaties actually in force between the two Powers, compensation for damage suffered during the war, and any justifiable rectification of frontiers. In the second it was laid down that Great Britain would not claim from Persia the cost of maintaining British troops in Persia for the defence of her neutrality, and asked Persia, in return, not to claim compensation for any damage done by her troops.

The Agreement was signed, but no immediate steps were taken to elect a new Majlis and submit it for ratification. In consequence, everything was held to be in suspense.

Finance.—In 1920 a British Financial Adviser was engaged by the Persian Government, a member of the Treasury staff being selected for the post. To a certain extent he could occupy himself with superintending the payment of money in connexion with the Cossack brigade and other matters in which help was given to the Persian Government, but his office was in suspense and the loan of £2,000,000 could not be made until the Agreement was ratified. With all overdue instalments paid up, the total debt of Persia as at Dec. 31 1920 was as follows:—

Loans	Original Amount	Outstanding
1. Russian 5% Loan of 1900, 1902 (Rubles)	32,500,000	31,223,170
2. Russian Consolidated 7% Loan 1911 (Krans)	60,000,030	31,524,501
3. Indian 5% Loan	£314,281 16s. 4d.	£180,421
4. Imperial Bank of Persia 5% Loan of May 8 1911	£1,250,000	£1,223,061
5. British Advances of 1912-4, 7%	£490,000	£490,000
6. Russian Advances (Rubles)	1,891,500	1,576,250
7. British Advances 1915-7	£817,000	£817,000
8. " " (Krans)	1,000,000	1,000,000
9. " " 1918 (Krans)	—	92,500,000
10. British Loan, Aug. 9 1919	£2,000,000	Not yet received

The Anglo-Persian Military Commission.—Among the important questions was the formation of a uniform force for Persia. An Anglo-Persian Commission was appointed and recommended a total strength of 60,000 men. As funds for such a force were not immediately available, it was decided to absorb the S. Persia Rifles, 6,000 strong; the Cossack division, 8,000 strong; and the Swedish gendarmerie, 8,400 strong. The total force would be gradually raised to 40,000 and all other troops would be disbanded. The Chief Military Adviser would be British and the Chief of the General Staff a Persian, although there was no Persian officer who possessed the qualifications. This scheme was in abeyance in 1921, pending ratification of the Agreement.

The Bolshevik Invasion of Persia.—In May 1920 the Bolshevik fleet from Baku bombarded Enzeli, took possession of the remnants of Denikin's squadron and leisurely occupied Resht, where a Provisional Government was formed under Kuchik Khan. The British detachment at Enzeli was withdrawn to Kazvin. At Teheran there was a panic and the British were blamed for not protecting Persia. The Cossack brigade recaptured Resht some months later, but finally retreated in a demoralized condition and took refuge inside the British lines. In March 1921 there was a considerable Bolshevik force in the province of Gilan, but it was thought unlikely to prove a serious threat to Persia until the brigade of British troops should be withdrawn from Kazvin.

Railways.—The question of railways has loomed large in Persia partly from the political and strategical and partly from the commercial point of view. For many years Teheran had been the unsuccessful hunting-ground of seekers for concessions, who had finally been replaced by the representatives of Great Britain and Russia. It may be readily granted that the only satisfactory solution of the problem of transport in Persia lies in the construction of railways. Their influence would probably help the country to pass quickly from the methods of transport used by the patriarch Job to those of the 20th century. But there are many difficulties to be mounted before railways can be constructed in Persia, the chief ones being financial and political.

Persia is a vast but miserably poor country with a scanty population living in isolated villages, generally lying many miles apart. The towns are small and do not increase, and there is very little trade. In the N. the country is more fertile, owing partly to a heavier rainfall, and there are important exports as well as imports, whereas in the S., if we except oil, there are practically no exports, carpets, pistachio nuts, opium, hides and wool making a small total compared with the large imports. In other words, unless minerals are found which it is profitable to export, Persian railways, constructed in the S. or W., cannot pay.

Had the Russian Government continued on the old lines it is probable that money would have been found for the construction of a railway across Persia. The grandiose scheme appealed to the Tsar, while his ministers considered that it would secure their hold on the Russian sphere and also bring them closer to the Indian Empire, thereby enabling them to exercise pressure on Great Britain. These facts were fully realized by the British Government, which was, however, unable to refuse to discuss the scheme and, in 1912, a *Société d'Etudes*, including British, Russian and French representatives, was formed, with the object of constructing a Trans-Persian railway. It was intended, in the first instance, to build a line to Teheran, starting from Alyat, a station to the S. of Baku. Negotiations in connexion with this, the first section of the Trans-Persian railway, were carried on until the outbreak of the World War. In addition to this important scheme the Russian Government in 1913 obtained a concession for the construction of a line to Tabriz, starting from the terminus of the Trans-Caucasus system at Julfa. This concession included rights for a service of steamers on Lake Urmia to which a branch was to be run, and also a concession for an extension to Kazvin. The line to Tabriz was opened in 1916.

Meanwhile the British had not been idle, and a syndicate, of which Messrs. Greenway & Lynch were the leading members, submitted to the Persian Government a scheme for the construction of a network of railways in southern Persia: (a) from Mohammerah or Khor Musa to Khurramabad and Burujird; (b) from Bandar 'Abbas to Kerman; (c) from Bandar 'Abbas to Shiraz; and (d) from Bandar 'Abbas to Mohammerah. This far-reaching scheme for a monopoly of railway construction in S. Persia included the right to develop ports where necessary. It also involved the issue by the Persian Government of bonds secured on the railways and their earnings and on any other available sources of revenue.

The syndicate decided to begin work on part (a) of the scheme. The base would probably have been Khor Musa, an inlet of the sea, which ran inland for many miles towards the Karun river and possessed remarkable advantages in the way of deep water and safe anchorage. The alternative was Mohammerah. The line would have been constructed across the level plain of Arabistan to Dizful and would then have risen through the hills to Khurramabad. Survey operations were attempted in the hills in 1913, but the greedy tribesmen attempted to levy such enormous sums for protecting the parties that the work came to a standstill. The results of the World War have entirely changed the position and it seems that this scheme will be allowed to fall into abeyance.

There is no doubt that if railways are constructed into the interior from the Persian Gulf, the port of Bandar 'Abbas, or perhaps a new port some miles to the W., will be selected. The route running across the Rudbar district and thence to Rigan and Kerman, over the low Gishu pass, avoids the very high passes to the S. of Kerman and, once the plateau is struck at Rigan, the country is ideally suitable for railway construction right across Persia. Upon the whole, this is the most satisfactory alignment. The route from Bandar 'Abbas to Shiraz and thence to Mohammerah would violate the principle that lines should be built into the interior and not run parallel to the coast, where they could not compete with sea transport.

After the World War the question of railways was again taken up by a strong group, which included Sir Charles Greenway, the chairman of the Anglo-Persian Oil Company. The scheme included a railway to Teheran from the Persian frontier at Kuraitu, at which point was the terminus of a metre-gauge line from Bagdad. A survey was commenced via Kermanshah, Hamadan, Kuzvin and Teheran. Surveys to Enzeli and Tabriz were also contemplated. It was agreed that, upon the completion of the surveys, the Persian Government would have the right to call on the group to construct the railway line or lines either as a Persian State railway or as a private company. No agreement as to terms was drawn up.

Medical Conditions.—Persia is divided up into a great elevated plateau which occupies the chief part of the area of the country and which is separated from the Caspian Sea in the north by a low-lying narrow strip of land from 20 to 60 m. broad, and from the Persian Gulf in the south by a strip of land little above sea level and about 40 m. in width. The strip of country bordering the Caspian Sea has a very high rainfall, its climate is damp and very relaxing, the temperature being moderate. Marshy and swampy areas with luxuriant forests and vegetation occupy a considerable portion of this part

of Persia. Mosquitoes, including the *Anopheles* varieties, are very numerous, and insect life is abundant. Malaria is very common, and few residents escape infection. The medical conditions prevailing here are those which are found in other damp relaxing climates with no great extremes of temperature. Tuberculosis is fairly common, and respiratory diseases such as bronchitis, pneumonia and influenza are prevalent. There is great overcrowding in the towns, and owing to the lack of adequate sanitation water-borne diseases such as dysentery, enteric fever and cholera are prevalent. Typhus and smallpox and the ordinary infectious fevers are common. Heat stroke does not occur, but owing to the high humidity the climate is very oppressive and trying to European residents.

The plateau region of Persia, occupying almost the whole area of the country, is divided into a mountainous portion which covers the whole of the western half of Persia, the general level being from 3,000 to 6,000 ft. above the sea, while the remaining portion of the plateau is chiefly desert and its general level is from 2,000 to 3,000 ft. above the sea. The climate of the Persian plateau is temperate, the summer temperatures not exceeding those of England. The winter temperature depends largely on the altitude, and extremes of cold are experienced. The atmosphere is invigorating and healthful, but in spite of this diseases of various kinds are prevalent owing to the lack of sanitary precautions. Water-borne diseases such as enteric, dysentery and cholera are prevalent, and this is largely due to the extraordinary fondness of the Persians for conveying water through numerous channels both above and underground in the towns and villages. The water usually comes from mountain springs and is clear and sparkling, but becomes contaminated in the course of distribution. No water should ever be drunk from these channels without previous boiling or chlorination; the remarks made in the article on MESOPOTAMIA relating to protection from water-borne diseases apply with equal force to Persia. Prophylactic inoculation with T.A.B. vaccine is essential as a protection against enteric. Malaria is very common owing to the breeding of mosquitoes in the various streams and water channels. The malaria is very frequently of the malignant type, and is often not controlled by the oral administration of quinine. The intramuscular or intravenous administration of the drug should always be adopted in such cases for the first few days of treatment, after which a full course of treatment by the mouth should be given. It is very remarkable to find malaria so prevalent and of so malignant a type at such a high altitude as that of the Persian plateau.

Overcrowding and herding together of the poorer classes of the population occur especially in the cold months, for housing accommodation is very insufficient. In consequence of this the common infectious fevers and smallpox are prevalent. Tuberculosis and influenza are rife, and the lice-borne diseases, typhus and relapsing fever, are of common occurrence.

A special type of relapsing fever occurs along the Zenjan-Tabriz route, which is spread by a large tick (*Argas persicus*) known as the "Mianeh bug," which has a great predilection for foreigners; this disease is very common at Mianeh and resembles clinically the lice-borne relapsing fever.

Eye disease is as common in Persia as Mesopotamia, and is due to the same causes. Sand flies are common and sand-fly fever is of frequent occurrence. Oriental sores are very common and are known by the Persian name "Salek," meaning a year, which is an average time for their duration. Venereal diseases such as gonorrhoea and syphilis are common amongst the natives.

Diarrhoeal diseases are very common in Persia, being spread by contaminated water, and food infected by dust and flies. These cause a very high infantile mortality amongst the natives. Neurasthenia and mental breakdown sometimes affect residents in Persia, the high altitude of the plateau being probably a causative factor.

In consequence of the Civil War and the Turkish and Russian invasions of 1914-7 much destruction of the dwellings of the poorer inhabitants occurred, and the animal transport so essential for the conveyance of food was greatly reduced. The food supplies were largely used up, and a serious famine occurred in 1917-8. Starvation carried off large numbers of the poorer inhabitants, and those debilitated by lack of nourishment and insufficient clothing became ready victims to such diseases as malignant malaria, dysentery, typhus, etc. (W. H. W.)

PERSIAN GULF.—The term "Persian Gulf" is, strictly speaking, restricted to the landlocked sea which extends in a south-easterly direction from the mouth of the Shatt al 'Arab 460 m. to the mountain mass of the promontory of Oman, terminating in Ras Musandam, but, for the purpose of this article, it will be considered to include the Gulf of Oman to which it is joined by the Strait of Ormuz, 20 m. wide. The Gulf itself has an average width of 120 miles. It is tidal, spring tides rising about 9 ft.; the water is somewhat saltier than the Indian Ocean, and seldom exceeds 10 fathoms in depth; with the exception of the Shatt al 'Arab, the Jarrahi and the Hindiyan rivers, which mingle their waters with those of the sea at the W. end of the Gulf, all the streams that flow into it are so salt as to be undrinkable. The

Euphrates and Tigris have within historical times silted up their mouths to an extent that has materially altered the coast-line of the Gulf and these rivers seem destined in the future to unite El Hasa to Fao, just as in the past they produced the fertile plains of Mesopotamia. The Persian Gulf is lacking in good harbour, anchorage being mostly shallow and exposed.

N. Coast.—From the Indian Ocean the Gulf of Oman is entered approximately where Persian territory begins at the tiny port of Gwattar. From Gwattar the coast-line, running W., first to the Strait of Ormuz, next along the N. shore of the Persian Gulf, and finally to the mouth of the Shatt al 'Arab, is nominally under the exclusive control of the Persian Government. The inhabitants of this tract are Persians or Arabs who by domicile and intermarriage with Persians have lost nearly all their racial and most of their social characteristics, but retain a dialect of Arabic as their mother tongue.

S. Coast.—The S. coast on the Gulf of Oman may be regarded as commencing from Ras el Hadd; it extends to the Ras Musandam. This coast is under the nominal suzerainty of the Sultan of Muscat, the principal ports from E. to W. being Sur, Muscat, Matra, Khabura and Sohar. From Ras Musandam westwards the Arabian shore is inhabited by tribes of Arab origin, which are independent and in treaty relation with Great Britain.

Up to 1913 the Turks exercised the right of suzerainty over the maritime districts of El Hasa and Hofuf, and claimed it in Qatar and Kuwait. The Emir of Nejd, 'Abd el 'Aziz Ibn Sa'ud, ejected them from the first-named districts; the war has put an end to their claims elsewhere in the Gulf. The Trucial chiefs of the Arabian coast hold sway between the peninsulas of Musandam and Qatar. From E. to W. their headquarters run as follows:—Ras el Kheima, Umm el Qaiwein, 'Ajman, Sharja, Dibai, Abu Dhabi, Qatar. The Sheikh of Bahrain exercises no authority over the mainland, which from the S. extremity of the bay in which Bahrain lies to Jebel Manifa N. of Qatif is recognized within the territories of the Emir of Nejd (see ARABIA).

The friendly attitude of Ibn Sa'ud on the outbreak of war with Turkey made it imperative that the British Government should come to a definite understanding with him, and he was recognized by a treaty dated Dec. 28 1915, as independent ruler of Nejd ar El Hasa, and given a limited dynastic guarantee, with a promise of support in case of foreign aggression. Great Britain assumes control of his foreign relations outside Arabia. He on his part undertook not to alienate any territory to a foreign Power, except with the consent of the British Government.

Shortly afterwards a treaty was made with the Chief of Qata whereby his position was assimilated to that of the Trucial chiefs. The British Government undertook in addition to afford their good offices to the Sheikh in the event of unprovoked aggression by land.

Climate.—The prevalent winds in the Gulf follow the configuration of the coast, i.e. N.W., known as the *shamal*, and S.E., known as the *gaus*. The former wind, rising often to a gale in a few hours and falling as suddenly, is foretold by no change in the barometer. With the *gaus* the reverse is the case. This wind is much dreaded by native mariners as it strikes nearly all the sheltered anchorages.

Rainfall varies from 6 in. at the W. end of the Gulf to a negligible quantity at Muscat. As is to be expected, the rainfall on the peninsula is somewhat greater than on the Arab coast. The influence of the S.W. monsoon, which is marked at Muscat, is scarcely noticeable in the Persian Gulf proper, though recent upper-air investigations conducted at Bagdad give some reason to think that the effects of the monsoon can be observed even there.

The temperature at the W. end of the Gulf varies from a minimum of 4° or 5° F. below freezing point at night in winter to a maximum of 115° F. in the shade during a few days in summer; the humidity of the air at Muscat is greater and the climate is, in consequence, much more trying, but even here a maximum of 109° F. has been recorded, the lowest minimum being 55°. Snow has been known to fall at Bushire. (A. T. W.)

Medical Conditions.—The medical conditions prevailing in the Persian Gulf are largely determined by the peculiarly trying climatic influences to which the inhabitants are exposed. The Arabian desert forms the W. and S. shores, which are almost uninhabited except for the small centres of population around a few widely separated towns, Kuwait, noted for its pearl fisheries in the N.W. corner, being the most important of these. The

¹The W. frontier of Persia was finally demarcated in 1914, a few months before the outbreak of war, by a mixed Anglo-Russian Persian-Turkish commission.

PERSIAN GULF

and N. shores are formed by the desert country of southern Persia, and are similarly very sparsely populated, Bushire, in the N.E. part of the Gulf, the port for the Shiraz district of southern Persia, and Bandar 'Abbas, at the entrance of the Gulf, being the chief centres of population. The hot season of the year is from May to October, July and August being the hottest months. The Persian Gulf has an unenviable reputation for its dangers from heat-stroke, and the sun's rays seem to have a peculiar deadly power in this region, for the risk of exposure is greater than in any part of the world, though other countries have a temperature which is equally high. The explanation is to be found in the extreme flatness of the country and the absence of trees or vegetation. The clear atmosphere is in its upper strata free from clouds and dust, so that the sun's rays undergo scarcely any absorption and strike down with full force on the light-brown desert soil, from which they are radiated and reflected to a great extent. The relative humidity of the air along the shores of the Gulf is high, so that exposure to the direct and reflected rays of the sun and radiation from the hot soil are encountered in a moist atmosphere.

So trying is the heat that some parts of the Persian Gulf are almost uninhabitable to natives in the hotter months. The greatest care requires to be taken by white races to avoid exposure to the sun and heat. Dwellings require careful construction, with thick walls and roofs of non-conducting material to keep out the heat-rays, and fans and punkahs are essential for the promotion of currents of air in the inhabited rooms. Personal protection, in the shape of thick pith topees, or cork helmets, and spinal pads, is necessary in the hot months, the clothing being light and loose and not too thin. Fatigue from physical exertion is a predisposing cause of heat-stroke, and constipation and alcoholic indulgence should be avoided.

Should a person be infected with latent malaria, heat exposure is very likely to induce an acute malarial attack and the combination is almost certain to lead to hyperpyrexia. On this account malarial subjects living in the Persian Gulf should take especial care to have an effective course of treatment in order to eradicate the disease as far as possible. The frequent association of heat-stroke with malaria is to be borne in mind in the treatment of heat hyperpyrexia, for, should the temperature of the patient not subside rapidly after treatment with cold sponging in a current of air or cold baths and ice, an intramuscular or intravenous injection of 10 grains of quinine bihydrochloride should be given without delay. In the case of white people exposure to heat of itself frequently causes heat-stroke, but probably in almost all cases of heat hyperpyrexia amongst natives the malarial complication is the exciting cause and therefore with them quinine treatment is all-important. Natives are generally immune to the effects of heat apart from other complicating causes of high temperature, such as malaria, etc., whereas white races may be affected with heat-stroke from heat exposure even if in perfect health. If a white person suffers in the hot months from any disease causing fever, e.g. enteric or sand-fly fever, etc., there is always a serious danger of hyperpyrexia, and this has to be guarded against.

The Effects of Heat.—The effects of exposure in the case of white races are not only manifested by the acute attack of heat-stroke, but, if this is avoided by proper care, it is nevertheless certain that long residence in the Persian Gulf causes a certain amount of tissue degeneration, owing to the exposure of the body cells to abnormal conditions of temperature. The highly specialized cells, viz. those of the nervous system, suffer most; and nerve-cell fatigue is shown by manifestations of neurasthenia. Lack of the power of brain concentration and severe inability to undergo the mental strain of arduous work are often the penalty which white races pay.

Beri-beri is a dietetic deficiency disease which manifests itself by cardiac weakness with shortness of breath, swelling of the legs and peripheral neuritis with numbness of the limbs and weakness. The climatic conditions of the Persian Gulf particularly seem to predispose to this disease, for it very frequently attacks white persons resident there, especially if they are exposed to dietetic hardships.

Residents in the towns along the Persian Gulf are exposed to the same dangers from disease as are experienced in similar places in Mesopotamia and Persia (see MESOPOTAMIA and PERSIA). Thus malaria and sand-fly fever, dysentery, typhoid and paratyphoid fever, cholera, smallpox, and occasionally typhus fever, eye diseases, oriental sores and indeed any disease conveyed by impure water, flies, contaminated dust or the contagion of sufferers from infectious diseases, are prevalent in the inhabited places along the Persian Gulf, and precautions must always be taken to guard against them.

(W. H. W.)

Geology.—Large portions of the littoral had not up to 1921 been examined geologically. Of the numerous islands that dot the Gulf many are partly at least of volcanic origin, notably Qishm and Ormuz.

The geological formations represented are the following in descending order:—

<i>Recent or sub-recent</i>	Shelly conglomerates and dead coral reefs of the littoral; red sandhills of the coast of Trucial Oman; alluvium of Turkish Iraq; river and lake deposits of Oman and the interior of Persia.
<i>Pleistocene</i>	Foraminiferal oolite or "Miliolite."
<i>Pliocene</i>	Bakhtiari series; grits and conglomerates.
<i>Miocene</i>	Fars series; marls, clays and sandstones with limestones and interbedded strata of rock gypsum.
<i>Lower Miocene</i>	Clypeaster beds of the Bakhtiari mountains.
<i>Oligocene and Eocene</i>	Nummulitic limestones of Persia; Muscat series; and Bahrein series.
<i>Upper Cretaceous or Lower Eocene</i>	Ormuz series; lavas and tuffs with interbedded clays and sandstones.
<i>Upper Cretaceous</i>	Hippuritic limestones of Persia and Oman.
<i>Jurassic or Lower Cretaceous</i>	Serpentinous and other igneous rocks of Oman.
<i>Carboniferous to Trias</i>	Oman series; limestones and slates with beds of chert.
<i>Archaeon</i>	Hatat beds; schists and quartzites.

The latest movement to which the Gulf has been or is now being subjected is one of gradual elevation, of which traces are found in recent littoral concretions, now as much as 450 ft. above present level, and in the flat ledge which surrounds Muscat harbour.

Numerous "shows" of petroleum exist along a broad belt running N.W. and S.E. through Mesopotamia and down the Persian Gulf. These are the most abundant at the foot of a chain of hills where the oil wells of Daliki, Bebehan, Ramuz and Shushtar, Dizful, Pusht-i-Kuh, and Qasr-i-Shirin are situated. Oil has, however, been struck in paying quantities hitherto only at a point 30 m. E. of Shushtar. Experimental boring on Qishm I. in 1916 had not given any result up to 1921.

Among other mineral products, asphalt is found at Bahrein; coal 30 m. inland from Sur, and some seams of good coal in newer strata; sulphur occurs in a fairly pure state at Khamir and Bustaneh near Lingeh, and on Qishm I.; copper, as copper glance and malachite, occurs in the interior of Oman; copper-mines are said to have been worked in the neighbourhood of the coast near Lingeh by the Portuguese, but all trace of them has been lost. Red ochre, for which there is only a limited market, is mined on Ormuz, Abu Musa and other islands in the Gulf; salt, as deposits, on Ormuz and Qishm I., and by evaporation, near Mohammerah, Fao and elsewhere on both sides of the Gulf; gypsum is widely distributed throughout the Gulf; iron, as haematite and pyrites, widely found through the Ormuz series.

Earthquakes are frequent and sometimes severe in the Persian Gulf proper, especially on Qishm I. and on the coast in the neighbourhood. In 1865 an earthquake levelled the villages of Darveh Asul near Mugam; in 1880 an earthquake caused 120 deaths in Basra; in 1883 severe shocks were felt from Bushire to Tahiri; in 1884 an earthquake caused 132 deaths on Qishm I., which was in consequence deserted; in 1897 an earthquake destroyed Qishm town and caused over 1,000 deaths; further shocks were experienced at Qishm and Bandar 'Abbas in 1902 and 1903.

Agriculture.—Cereals are produced in considerable quantities in the hinterlands of Mohammerah and Bushire and in the intervening coastal strip; the rest of the Gulf largely depends on imports from this part of Persia or from India. Dates are grown for the European market at Muscat and for local consumption on both sides of the Gulf, but not in considerable quantities. The Muscat date reaches maturity sooner than the Basra crop, and is commercially valuable.

Live Stock.—Camels are abundant on the Arabian side of the Persian Gulf littoral and are also found on the Persian coast, especially where the country is open. Horses are scarce in Oman and few are kept in Trucial Oman or in Bahrein or El Hasa. But they are more common in Qatar and Kuwait. Nejd, or Central Arabia, is the principal horse-breeding country adjacent to the Persian Gulf, and is the only one in the world, except the adjacent Syrian desert, where the genuine Arab is produced on any considerable scale.

Sailing Craft.—The Persian Gulf is by tradition the home of sailing craft, for their skill in handling which the Phoenicians afterwards became famous in the Mediterranean. There are some 14 types of native craft which belong to the Persian Gulf proper. The same principle of construction applies to nearly all; as a general rule these vessels are remarkable for the beauty of their lines. They sail well and are weatherly craft. The principal shipbuilding centres in the Persian Gulf are now Kuwait, Sur in Oman and Lingeh.

Fisheries.—Few seas are more prolific in fish than the Persian Gulf and the Gulf of Oman; the great proportion of known species are edible and many have a commercial value for the isinglass or oil

extracted from them. Fish are extensively used for manure, especially in Muscat, where they are also fed to cattle without unpleasant results. Sharks are caught in enormous numbers with hook and harpoon; the flesh is considered by some to have aphrodisiacal properties; the dried fins and tails are exported to China; the oil is used for smearing boats. The turtle is also found, the carapace being exported as tortoiseshell, the animal being gently roasted or boiled alive over a slow fire to facilitate the separation of the shell from the flesh. The whale is often seen in the Gulf of Oman; porpoises and swordfishes are common.

Pearling Industry.—The pearling grounds of Bahrein are in over six fathoms of water, mostly beyond the three-mile limit. The geological formation of the bottom of the Persian Gulf and the temperature and shallowness of its waters appear to be favourable in a high degree to the growth of the pearl oyster. The pearl banks which are known and actually worked occupy a very considerable proportion of the whole area of the Gulf, chiefly upon the Arabian side. The pearl banks on the Persian side are found chiefly on the coast between Lingeh and Tahiri, and again in the neighbourhood of Kharag Island. The largest and most productive of all the banks are situated on the Arabian side of the Gulf and are fished annually; the banks of the Persian coast are poor as well as small and are fished at infrequent intervals. The total value of pearls exported was estimated in 1905 at about £1,500,000, the value at current prices of the 1919 outturn was probably about £2,500,000. Mother-of-pearl was exported before the World War to the value of £20,000; after the war high freights and absence of demand from Hamburg, the principal market, killed the trade for the time being. Some 4,500 boats employing some 75,000 men are employed in the pearling industry during the season, which lasts for almost three months, and can do little else but fish for the rest of the year.

Commerce.—A summary of import and export values of trade in the Persian Gulf, excluding Mohammerah and Basra, is appended. It is, however, not possible to make reliable deductions from these figures taken by themselves. The normal value, for example, of the post-war exports of Bahrein should be more nearly £3,000,000 than £1,000,000, owing to the enhanced value in terms of money of pearls, and the export trade of Bandar 'Abbas should likewise be more in a normal post-war than in a pre-war year. Of the total imports from 1912-3, one-half come direct from India and a quarter from the United Kingdom direct, the balance from foreign countries, European and Asiatic, in about equal proportions. For the latest post-war statistics up to 1921 the proportions were respectively two-thirds, one-sixth and one-sixth, owing primarily to the almost complete cessation of direct shipments from Europe to the Persian Gulf.

Mail Communications.—The Persian Gulf was at the end of the 18th century the most rapid route between Europe and India, and it was not until 1833 that the Red Sea route was adopted by the East India Co.; from this date until 1862 the Gulf fell into an extraordinary state of inaccessibility—letters for India being sent from Bagdad and Basra via Damascus, and correspondence from Bushire for Bagdad via Teheran. In 1862 the British India Steam Navigation Co. undertook their first mail contract for the Persian Gulf, and simultaneously the Euphrates-Tigris Steam Navigation Co. agreed to run a subsidized line of mail steamers from Basra to Bagdad.

The British India Co. maintain weekly and fortnightly services between Basra and the Persian Gulf. The fast weekly steamer stops only at Karachi, Bushire and Mohammerah on its way to Basra. The slow mail steamers stop at every port in the Gulf, either on the upward or the downward voyage.

Posts.—The reopening in 1862 of direct communications between India and the Persian Gulf gave rise to a demand for properly organized post-offices, and the Indian Postal Department accordingly opened branches in 1864 at Muscat and Bushire. Every port of importance on both sides of the Persian Gulf has an Indian post-office transacting all classes of business.

The existence of these offices on Persian soil has occasionally been the subject of complaint by the Persian Government. The justification for their continued existence has been found in the climatic conditions of the Gulf, which make it difficult for the Persian Government to staff their own offices adequately, and in the fact that the rupee is the only currency common to all ports of the Gulf and to India, while the trade of these ports is mainly with India.

Telegraphs.—The inception of the Persian Gulf telegraphs, which formed the first links in an intercontinental chain, was dictated not by local interests, but by broad considerations of national advantage. The Crimean War of 1856 brought home to the Porte the slowness of communication between the Persian Gulf and the outlying provinces of the Turkish Empire, while the Mutiny of 1857 taught the British Government a similar lesson in regard to India. In 1857, after some unfruitful preliminary attempts, the Turkish Government agreed to the construction of a line from Scutari to Bagdad on their behalf; this was finished in 1861 and was extended to Fao by 1864, after further lengthy negotiations, when it was linked up with the cable from Karachi which had been laid meanwhile. The route of the cables has been several times altered. They now run from Karachi to Jask, whence a cable runs to Muscat; from Jask one cable runs to Hanjam, and thence to Bushire; another cable runs direct to Bushire. Hanjam is connected by cable with Bandar 'Abbas. A double cable connects Bushire with Fao. Bushire, Hanjam, Bahrein, Abadan and Basra

Summary showing Import and Export Values of Trade in the Persian Gulf (excluding Iraq and Arabistan) in two pre-war years and in the latest post-war year available.

	Imports			Exports			Total
	1912-3	1913-4	Post-War Year	1912-3	1913-4	Post-War Year	Post-War Year
<i>Arab Side</i>

Banks.—The Imperial Bank of Persia, in addition to branches all over Persia, has branches at Bushire, Bandar 'Abbas and Mohammerah. The Eastern Bank has a branch at Bahrein.

Currency.—Persian currency alone is legal in Persia, but the rupee is freely current in Persian ports. On the Arab coast the rupee is legal tender, and is almost exclusively used for commercial transactions, but the Maria Teresa dollar circulates freely, and is preferred by the inhabitants of the interior of Arabia. Persian currency is also in use, principally in Bahrein.

Lights and Buoys.—In view of the difficulties attending navigation in the Gulf, and the impossibility of arranging with the Governments of the littoral for the provision of lights and buoys except on terms which would have greatly hampered shipping, the British Government, in view of the great preponderance of British shipping in the Gulf, has established since 1912 a very complete system of lights and buoys, the cost of which is shared in equal moieties by the Government of India and H.M. Government in accordance with the recommendations of the Welby Commission. Lighthouses exist on one of the Quwain group of islands off Ras Musandam and on Tunb I.; light-buoys have been placed at Bushire in the outer and inner anchorages, at Bahrein and on the Shatt al 'Arab bar. Shore lights and unlighted buoys have also been provided where necessary. There is a lightship in the Shatt al 'Arab bar, which is very completely buoyed and lighted throughout its length from the lightship to Fao, where there is a fixed light.

are provided with wireless stations. Kuwait is connected by land line with Basra; Jask is connected by a land line to Karachi. Mohammerah is connected by land line and cable with Basra and Abadan and via Ahwaz with Bushire and with the inland Persian system. Bushire has its own telephone system; Mohammerah is connected by telephone with Basra. The whole system is under the control of the Indo-European Telegraph Department, whose director-in-chief is responsible to the Secretary of State for India. The Department, which also controls the principal international lines in Persia, is amply self-supporting.

Population and Religions.—In all the countries of the Persian Gulf, Islam in one or another of its forms prevails, almost to the exclusion of other religions. The Mahomedans of the Persian Gulf region belong to the following denominations:—Sunni, Shi'ah, Ibadhi, Wahabi and Khojah. The Wahabis may be regarded as a branch of the Sunnis and the Khojahs as a branch of the Shi'ah. Shi'ahs predominate on the Persian coast except in the district of Rud Hilleh, Shibkuh, Lingeh, Bastak, Biyaban, Jask, and on the islands of the Persian Gulf. The Persian province of S. Arabistan which is under the hereditary government of the Sheikh of Mohammerah, is exclusively Shi'ah. The Sunnis are estimated at 100 out of a total population in the maritime districts of 300.

Persian Makran is exclusively Sunni except for the district of Jask. At Gwadar, Sunni, Khojah and Ibadhi rub shoulders. The Oman sultanate is predominately Ibadhi. In the territory controlled by the Emir of Nejd the official religion is Wahabi, but a few Shiahs are still to be found in the districts of El Hasa and Hofuf. Bahrein is Sunni, but has a large Shiah population of Persian origin. Kuwait is Sunni, with Wahabi leanings.

The Khojahs number some 2,000 souls and are distributed over the ports of the Gulf, mainly on the Arab side. They are descended from Hindus of Sind and Kach, who were converted from Hinduism to the Isma'ili form of the Shiah faith in the 15th century of the Christian era.

Hindus total about 1,500 and are to be found in all the principal ports of the Gulf, especially at Gwadar, where their presence gives rise to occasional fanatical disturbances. Panislamic ideas have obtained little hold in this region; in Persia and wherever people are Shiahs the pretensions of the Sultan of Turkey to the headship of the Mahommedan world are rejected, as also in Oman, where the bulk of the population are Ibadhi.

Missions.—Roman Catholic missions have at intervals worked in the Persian Gulf, on the Persian side since the beginning of the 17th century; they are still represented at Bushire. The first Protestant mission to the Gulf was initiated by Henry Martyn in 1811; his Arabic New Testament appeared in 1816. The American Arabian mission was founded in 1889 in the United States; the first agents of the mission were the Rev. J. Cantine and the Rev. S. Zwemer, who established a branch at Bahrein in 1892 and later at Muscat. Political complications arising out of the work of the Arabian mission have been singularly few, a happy circumstance which must be attributed chiefly to the missionaries themselves, whose general opinion is that for a Mahommedan country the Persian Gulf and eastern Arabia are peculiarly free from religious fanaticism.

Historical.—The Persian Gulf has figured in history from the earliest times. A myth (preserved by Herodotus) records that Onnes (Hea) the fish-god came up from that part of the Erythraean Sea which borders on Babylonia, to teach the inhabitants of that country letters and sciences and arts of every kind. This seems to indicate the arrival, in ships, of strangers of a higher grade of civilization. These strangers may have come from China, but Sir H. Rawlinson considers they were a dark race not belonging to the Semitic family. Rawlinson also suggests that the Phoenicians may have originally come from the Bahrein Is. and extended westwards to the settlements on the Mediterranean at least 5,000 years ago. Though there is no direct evidence of this connexion, enormous numbers of tumuli, probably of Phoenician origin, exist on the Bahrein Is., which also contain tumuli of Babylonian age. Babylonian tumuli have also been found at Bushire. Col. Yule, from Chinese annals of the 7th and 8th centuries, says that Chinese ships came as far as Siraf (Tahiri) and the Euphrates, where they lay at Hira near Kufa, and adds that this trade fell off in A.D. 878 owing to civil war in China. From the records of Fa-Hian of the 4th century it is clear that ships from China exchanged merchandise with Arab vessels at Ceylon, and this is confirmed by the account of Cosmas, who wrote between 530 and 550 A.D. Along the shores of the Persian Gulf in 326 A.D. came Nearchus, the admiral of Alexander, on his way from the Indies to the Tigris delta; from Basra sailed Sindbad in the 9th century in one of the many Arab craft which traded thence to India, Ceylon and Zanzibar. Thousands of years before Christ the pearls of Bahrein were sold in Egypt; Bahrein still supplies 80% of the world's output of pearls. After the Phoenicians, Babylonians, and Arabs came the Persians; though they never aspired to command of the seas and are indeed not a maritime race, the Persian Gulf was no obstacle to them, and at one time or another they occupied Muscat and parts of Oman and Bahrein, and penetrated into the greater part of Arabia.

Commerce between East and West had from early times followed this route in preference to that of the Red Sea, and when during the 15th century Genoa and Venice successively lost their positions in Oriental commerce, through the capture of Constantinople by the Turks and by the hostility of the Mamelukes of Egypt respectively, the country which most earnestly devoted itself to the quest of a new way to India was Portugal. Albuquerque seized several towns on the coast of Oman, including

Muscat in 1507, and soon afterwards established his authority on the I. of Ormuz, at the N. of the Gulf. Towards the end of the 16th century the Dutch made their appearance in Indian waters as rivals of the Portuguese; and in 1616 the first British "factories" of the East India Co. were established on the Persian coast. In 1622 the Portuguese were expelled from Ormuz by joint efforts of the British by sea and of the Persians by land; in 1650 they finally left Muscat. In 1664 the French made their appearance on the scene, but did little trade. It is, however, of interest to note that in 1698, in consequence of a nominal agreement, from which nothing resulted, among the principal Europeans in the East, the French undertook the policing of the Persian Gulf against pirates. The Dutch, who had played no part in expelling the Portuguese, now became increasingly predominant, and the wars that were waged in Europe between England and Holland had their counterpart in the Persian Gulf.

In 1674 hostility between Holland and England ceased, but the position was radically unsatisfactory owing to the prevalence of piracy, from which both England and other nations suffered heavily. At the beginning of the 18th century the improved state of affairs in India began to have an effect on the Company's branches in the Persian Gulf and by the middle of the 18th century the Dutch settlements had disappeared.

Henceforward the bulk of the trade was in British hands, but piracy was rife, the slave trade flourished, and the coast towns and islands of the Persian Gulf had fallen from their ancient prosperity to a lower level than they had experienced for some centuries. To restore this prosperity had for about a century before 1921 been the secular mission of Great Britain in these lands, the British resident in the Persian Gulf, acting as the representative of the Government of India, being the umpire to whom by long custom all parties on both coasts appealed and who had by treaties been entrusted with the duty of preserving peace.

Students of international politics are familiar with the claims of nations to a position of preference in certain regions, based upon historic, economic or geographical considerations. The claims of Great Britain to such a position in this region are unique. But beyond two brief occupations of the I. of Kharag, and the continuous possession of a few square miles of desert land at Basidu, the S.W. end of the I. of Qishm, she has at no time acquired territory in that region, although she has for generations borne an honourable burden there which no other nation has ever undertaken anywhere, except in the capacity of sovereign. British influence kept the peace amongst peoples who were not subjects of the King-Emperor; Great Britain lighted, buoyed, chartered and patrolled for over a century waters over which it claimed no formal lordship; and kept in strange ports an open door, through which traders of every nation might have equally free access to distant markets. On the other hand, a steady and increasing market was gained for the products of the British Empire, and in particular for those of India; the ports of the Gulf were made safe, not so much for the British as for the Indian trader; nearly 75% of the trade of the Gulf ports was in 1921 with India, and an even greater proportion in the hands of Indians, Persians and Arabs. A good market had been created for Indian products, particularly yarns and cereals. But more than this, Great Britain had gained a reputation for patient and persevering efforts to promote the spread of civilization in these regions, a prestige which yielded profit during the difficult years of the World War, and was not without its effect in India. With the exception of local disturbances of old standing at Muscat, and at Bushire (where they were fomented by German gold), the Arab and Persian population of both shores maintained a friendly attitude to Great Britain throughout the war, although British gunboats were seldom, if ever, seen at that time in waters which in peace they had regularly patrolled.

The peculiar interests, strategic, political and commercial, of Great Britain in the Persian Gulf have never been denied; they are intimately connected with the welfare of India, with the security of its communication with the outside world, and of its internal tranquillity. The considered policy of the British Government was embodied in 1903 in Lord Lansdowne's declaration in the House of Lords that "we should regard the establishment of

a naval base or a fortified port in the Persian Gulf by any other Power as a very grave menace to British interests, and we should certainly resist it by all the means at our disposal." This declaration was formally reaffirmed in 1907 by Sir E. Grey, in a despatch to the British ambassador at St. Petersburg, which further stated that "H.M. Government will continue to direct all their efforts to the observance of the *status quo* in the Gulf, and the maintenance of British trade; in doing so they have no desire to exclude the legitimate trade of any other Power." These declarations were never openly challenged, and in 1912-4 the British Government entered into far-reaching negotiations with the Turkish and German Governments with the object of regularizing the position. The resulting agreements had not, however, been ratified before the declaration of war in 1914.

The Arms Traffic.—During the 3rd Afghan War the trade in modern arms and ammunition in the Persian Gulf attracted the attention of the British and Indian Governments for the first time. In 1880 the Government of India took preliminary steps in the matter within its own borders; in 1881 the importation of arms and ammunition into Persia was made illegal, but with little effect. In Far Eastern countries firearms are widely possessed and used. In 1890 the General Act of the Brussels Conference struck a blow at the arms trade in Africa and diverted it to the Persian Gulf, which was not subject to the Brussels Act.

The stream of arms flowing from Zanzibar to Muscat continued to increase in volume, and in 1892 no less than 11,500 firearms were landed at Muscat, of which more than half were at once re-exported. The figure was doubled by 1895 and trebled in 1897; in spite of prohibitions, imports into Persia continued on a large scale. Moved at last by the great quantity of military material that was being found in the Gulf, the British Government urged the Persian Government to enforce the actual law and to confiscate the stores of arms which had accumulated at Bushire. The Persian Government, thoroughly alarmed, took action, but with only temporary effect. Somewhat similar action was taken at Bahrein. These seizures created much indignation and anxiety among firms in England whose interests were involved.

From 1898 to 1908 the attitude of the British Government towards the question was one of regular attention without the power to intervene directly or effectually. In 1900 the consignment of arms and ammunition to the Persian Gulf through Indian ports with or without transshipment was made illegal. This was reinforced by an Act of Parliament empowering the sovereign to prohibit by proclamation the export of arms and ammunition from the United Kingdom to countries or places where they might be employed against British troops and subjects.

The trade, blocked at Persian ports and later at all Gulf ports except Muscat, continued to flourish, in spite of a naval blockade of the Makran coast by Great Britain in 1910-1. At length, however, in 1912 the Sultan of Muscat issued a proclamation requiring all arms imported into Muscat to be placed in a special warehouse from which they could not be removed except on production of an import permit from the competent authority at their destination. This killed the trade at Muscat; the French Government, who had claimed that the Sultan's proclamation was inconsistent with his treaty engagements with them, accepted the accomplished fact with good grace after lengthy diplomatic negotiations, and the trade was by 1913 almost dead, except at the N. end of the Gulf, where it still flourished on a small scale. The arms traffic has been responsible for much of the prevailing anarchy of the Middle East and indeed of Arabia. The possession of firearms places irresistible temptations in the path of unsophisticated and quick-tempered tribesmen. For this result the European Powers signatories of the Brussels Act of 1892 are to blame for lack of foresight and to some extent of goodwill. Joint Anglo-French action at any time during 1902-12 would probably have been effective in stopping the traffic.

Slave Trade.—On board the fleet which in 1626 conveyed Sir Dodmore Cotton, a British ambassador, with his staff, from Surat to Bandar 'Abbas, there were more than 300 slaves bought of Persians in India, and the only remark which this circumstance suggested to Sir T. Herbert was that "ships, be-

sides the transporting of richer varieties from place to place, consociate the most remote regions of the earth by participation of commodities and other excellencies to each other." In 1772 it was decided by the English courts that a slave as soon as he set foot on the soil of the British Isles became free; the slave trade, however, continued actively until 1807, when an Act was passed to prevent British subjects dealing in slaves; in 1811 the traffic in slaves was declared to be felony; in 1833 the status of slavery was abolished throughout the British Dominions. In defiance of her commercial interests and of her popularity with the Moslem population of the Gulf, Great Britain set herself to suppress the trade, and executed a series of agreements with the chiefs of the Arabian littoral with this object. The arduous task of enforcing the observance of these treaties fell upon the Government of India and involved great sacrifice of lives and money.

In subsequent years over 700 slaves were rescued at sea and more than 2,000 otherwise released; the traffic was by 1920 virtually dead in the Gulf, but slavery as an institution seemed likely to continue for many decades to come to flourish inland in Muscat, in Central Arabia, and in a modified form in part of Persia.

AUTHORITIES.—The chief source of information is the late J. G. Lorimer's *Gazetteer of the Persian Gulf*, published confidentially by the Government of India in 1908. See also Lord Curzon's *Persia* (1892); papers by T. J. Bennett, of *The Times of India* (Royal Society of Arts, 1902), and the late Comm. A. W. Stiffe, *Indian Navy* (*Jour. R.G.S.* 1897); and handbooks prepared during the war of 1914-8 under the direction of the Historical Section of the Foreign Office. (A. T. W.)

PERTAB (or PARTAB) SINGH, SIR (1844-), Indian soldier and statesman (*see* 21.250), relinquished his position as Maharaja of Idar in 1911 in favour of his adopted son Daolat Singh, in order to resume the regency of Jodhpur which he had previously held on the death of his brother in 1895, but this time for his grand-nephew Sumair Singh, then 13 years of age. When the World War broke out Sir Pertab, in the words of Lord Hardinge the Viceroy, "would not be denied his right to serve the King-Emperor in spite of his 70 years." He came to France for service in the field with his young ward, then only 16, and commanded the famous Jodhpur Lancers. In the later stages of the war he served with them in Egypt and Palestine. Sir Sumair Singh died in 1918, two years after receiving ruling powers, and Sir Pertab again became regent, assisted by a council.

PERU (*see* 21.264).—No accurate statistics for the pop. of Peru exist, but probably there are between 3,500,000 and 4,000,000 inhabitants besides the savage tribes, still partly independent, who inhabit the remoter *montaña* or eastern forest region. The racial proportions are approximately:—

Negroes, pure-blooded or predominantly African	6%
Various (including Asiatics, African-Indian mixture, etc.)	10%
Indians, pure-blooded or nearly so	52%
Mestizos (mixed Indian and white blood)	30%
Whites (entirely of Caucasian blood)	2%

The negroes are either descendants of slaves of colonial times or, in fewer cases, people who have drifted in during recent years from the Barbados, Trinidad, Panama, etc. Though the negroes of colonial times were notorious for their brawls and riots, those of to-day seem to be reasonably law-abiding. They are addicted to many vicious practices which are gradually causing the population of Lima and other coast cities to decrease in physical strength and intelligence. Most of the negroes live on the coast. The Indians fall into two groups: those who dwell in the highlands or *sierra* in the interior and still preserve their ancient language and customs, and those who live on the coast and speak Spanish, dressing more or less after the European fashion and observing but few customs that can be called pre-Spanish. The lot of the highland Indians is, in many districts, very bad. This is due to three chief causes: the abuse meted out by the great landed proprietors ever since the conquest (1531) and continued with some abatement to the present day; the use of far too much alcohol and coca; the lack of even rudiments of public or personal hygiene. There is much evidence, however, that the lot of the Indians will improve within a generation or two. The younger generation of the land-holding class are beginning to see that it will be to their advantage to improve the material and social condition of the Indians on their estates; there is an increasing agitation in favour of suppressing the sale of sugar-brandy and other harmful liquors to the Indians and of regulating the consumption of coca; at the present time the Peruvian Government is beginning to take serious measures for the sanitation of the country. The *mestizos* compose the middle class, the artisans, small shopkeepers, clerks,

petty politicians, etc. They tend to congregate in the cities. They are mostly unintelligent, though a small percentage of them enjoy an improved social status, won usually by the exercise of an intellectual calling, the law, medicine or literature. The *whites*, though few in number, were, until the revolution of July 1919, the dominant class in Peru. They owned most of the land and controlled all the more important political posts. For the most part they are thoroughly modern-minded and progressive people, intellectual and agreeable. It is to be regretted that few of the older generation recognized their responsibilities with regard to their Indian tenantry, but the younger men, according to observations in 1921, were beginning to take an interest in sociological problems.

Since 1890 all the Government railways then in existence, and additions to them made later, have been administered by the Peruvian Corporation, chiefly owned by foreign investors, which took over the railways and a number of other national resources. In 1920 the railways administered by the Peruvian Corporation were the following:—

	Length (miles)	Gauge (meters)
Central railway	248	1'44
Pisco to Ica railway	46	1'44
Southern railway	535	1'44
Pacasmayo railway	82	1'44
Paita to Piura railway	60	1'44
Chimbote railway	35	'91
Trujillo railway	64	'91
North-western railway	132	'91
Lima-Lurin railway	22	'91

Besides these important lines there are a number of others neither owned by the Government nor administered by the Peruvian Corporation. Chief of these are the Cerro de Pasco railway from Oroya to Cerro de Pasco and a few local lines in various coast valleys.

In the 10 years, 1910-20, a certain amount of road-building was done. In many parts of the coast comparatively little has to be done to make the surface of the desert a good road-bed for motor traffic. During the rubber boom of the previous decade there was a considerable development, in the forest region, of river traffic. But since 1910 that has slowly been diminishing, and in 1920 the Peruvian reaches of the Amazon were served by but one steamer which made one round trip per month.

Coastwise traffic by steamers is well organized and efficient. Two companies, one British and the other American, maintain direct sailings from New York to Callao, through the Panama Canal, the run being made in 12 days. There is also good direct service with England, the Mediterranean and Japan. The smaller ports of the Peruvian coast are served by the steamers of the Peruvian line, the Chilean line, the British line and a number of less important steamers. A direct service for freight only was in Feb. 1921 about to be inaugurated between the Peruvian coast and California. The telegraphs, wireless included, were in 1921 owned and administered by the Government. Experiments were then being made with the wireless telephone, also under Government. Two privately owned cable companies give coast and foreign service.

Industries and Commerce.—The chief exports of Peru are sugar, cotton and copper. There should be many other articles. Petroleum is already produced in considerable quantities, but Peru could attain a production of vegetable oil fully as important. Castor oil, linseed oil, cottonseed oil and rapeseed oil are a few of the possibilities. Meats, hides and wool could easily be exported on a large scale. Lumber, in the lower or easterly parts of the country, might well be made to take the place of the lost rubber trade. Peru suffers from the unimaginative ultra-conservatism of her landowning class and of her business men. The fundamental need is capital, and the only people in the country who have sufficient initiative to undertake these developments lack capital. Vanadium mining has been undertaken with unusual energy, and it is said that Peru to-day produces 95% of the world's vanadium.

Imports and Exports.
(In Peruvian pounds, equal to £ sterling.)

	Imports	Exports	Excess of Exports
1910	4,980,697	7,974,076	2,993,379
1911	5,438,245	7,422,027	1,983,782
1912	5,140,338	9,438,581	4,298,243
1913	6,088,776	9,137,780	3,049,003
1914	4,827,930	8,767,790	3,939,860
1915	3,095,544	11,521,807	8,426,263
1916	8,683,150	16,541,063	7,857,913
1917	13,502,851	18,643,414	5,140,563
1918	9,705,113	19,972,595	10,267,482

The effect of the World War upon Peruvian trade with Great Britain and the United States is displayed by the following table (in Peruvian pounds equal to £ sterling):—

	Imports from G.B.	Imports from U.S.	Exports to G.B.	Exports to U.S.
1912	1,367,976	1,248,880	3,237,564	3,599,851
1913	1,598,605	1,755,251	3,403,109	3,033,259
1914	1,338,552	1,570,723	3,274,097	3,046,892
1915	662,546	1,488,264	3,621,624	6,390,282
1916	1,496,304	5,116,582	2,961,841	10,404,334
1917	1,934,665	8,792,710	3,792,750	10,942,407

Government.—The Government of Peru is one of the most highly centralized in the world. Every question has to be decided in Lima, by the supreme Government, and often by the president in person. Directly or indirectly the president appoints all the prefects, sub-prefects and governors who administer the provincial subdivisions of the country. All of these officers are removable at his will. The Legislature (Chamber of Deputies and Senate) controls the purse-strings of the nation and acts as a check on executive extravagances.

From 1860 to 1919 the supreme law of the land was the Constitution of 1860. That constitution embodied all the leading principles of the extreme centralization already referred to. There was, however, a pronounced movement toward "regionalism" in the southern departments between 1910 and 1919. That movement aimed not only at liberalizing the administrative machinery, but also at a systematic improvement of the condition of the Indians.

In Jan. 1920 President Leguía's Government brought into being the Constitution of 1919, prepared chiefly by Senator Mariano H. Cornejo and Don Germán Leguía y Martínez. That constitution makes concessions to the demand for regionalism by creating "Regional Congresses," three in number, one for the north, one for the centre and one for the south.

History.—From 1908 to 1912 was the first term of Augusto B. Leguía y Salcedo as president of Peru. A number of internal reforms and improvements were planned by him, but the collapse of the rubber market caused great financial stringency and had the indirect result of curtailing the Government's reforming activities. It was during this first term of Leguía that the Yale Peruvian expedition, headed by Prof. Hiram Bingham of Yale, conducted extensive geographical and archaeological explorations in Peru. The results were published and did much to direct the attention of foreign capitalists and others to Peru. Other Yale expeditions continued their work in Peru until 1915 when, as a result of misunderstandings, Prof. Bingham and his followers were ordered out of the country. Between 1912 and 1915 Guillermo Billinghurst and Oscar Benavides were presidents, each for a short term of revolutionary character. During this period there were diplomatic conflicts between Peru and Bolivia and Peru and Ecuador, neither of them going so far as to become military in character.

The outbreak of the World War in Aug. 1914 found Peru in an exceedingly bad state financially and economically. Until well into 1915 financial depression of the most acute kind continued. But about the middle of 1915 a great demand for Peruvian cotton, sugar, copper and other products came into being, with the result that exportations, at war prices, attained proportions never known before.

From July 1915 to July 1919 José Pardo y Barreda was President. In his time came the question which side was to be favoured by Peru in the World War. The then ruling class was inclined, at first, to be pro-German, partly because they were not fond of England (due to conflicts with the Peruvian Corporation), partly because they did not like the "democratic" atmosphere of President Wilson's various documents, and also partly because they had personal, financial and sentimental ties with Germany. On the other hand, many members of that class and the mass of the thinking element of Peru as a whole were strongly in favour of the Allies. Consequently, soon after the declaration of war by the United States in 1917, the Government of Peru severed diplomatic relations with Germany.

On July 4 1919 Don Augusto B. Leguía, who had been elected president to succeed Don José Pardo y Barreda (president 1915-9), seized the person of President Pardo by means of a re-

volutionary movement and himself became provisional President, being again duly reflected to the presidency some time after. This movement caused profound consternation in Peru, where people were beginning to assure themselves that the day of revolutions was over. Leguía inaugurated an ambitious scheme of internal reform, including the sanitation of 31 Peruvian cities, the reorganization of the army by a French Military Commission, the reorganization of the navy by an American Naval Commission, the reconstruction of the educational system by American experts, and huge irrigation works built under the direction of an American engineer, C. W. Sutton.

The most important reforms brought about by the Government of President Leguía were those calculated to modernize the country. President Pardo had inaugurated the practice of calling in foreign expert advice by inviting to Peru Dr. Henry Hanson, of the department of public health of the Panama Canal zone. Dr. Hanson was first invited to study the malarial fevers in the vicinity of Lima, but in July 1919 a serious yellow-fever epidemic broke out in Piura, the northernmost coast department of Peru, and he was sent thither with full authority to stamp it out. He continued in Peru as director of sanitation, and his work was much widened so as to include the general sanitation of Callao and the stamping-out of a bad epidemic of yellow fever which broke out in the department of Lambayeque in Jan. 1921. The late Gen. William Gorgas was also invited to Peru in 1919 in order to supervise extensive projected improvements to be carried out by the Foundation Company of New York. Those improvements were to include the resewering of Lima, the repaving of many chief streets of Lima and the sanitation of 31 Peruvian cities. There was much opposition to the contract made between the Peruvian Government and the Foundation Company—Congress, for example, being largely of the opinion that the contract was derogatory to the dignity and probity of Peru. This, together with the death of Gen. Gorgas, practically nullified the projected improvements.

A French Military Aviation Commission, headed by Gen. Vassal, came to Peru soon after President Leguía assumed office. It was intended to instruct officers of the Peruvian army in the use of various types of aeroplanes, and a school was founded at Maranga, near Lima. Proper financial support was not forthcoming, however, and in the middle of Feb. 1921 the French mission resigned, complaining that the situation in which they found themselves was intolerable. An American Naval Commission, headed by Capt. Frank B. Freyer, U.S.N., was called to Peru in July 1920 for the purpose of reorganizing the sea forces of Peru. In Jan. 1921 Capt. Freyer was made chief of staff with powers practically equal to those of the minister of marine.

Educational improvements under the general supervision of the minister of justice and instruction were undertaken. A large number of American educational experts, under the leadership of Dr. H. Erwin Bard, went to Peru, and Dr. Bard was made director-general of instruction (1921). The National Museum of Archaeology, likewise dependent upon the minister of justice and instruction, was also placed under an American expert from the Smithsonian Institution. (P. A. M.E.)

PÉTAIN, HENRI PHILIPPE BENONI OMER JOSEPH (1856–), French soldier, was born on May 24 1856. He was commissioned from St. Cyr 1878, passed in due course through the École de Guerre, filled various staff appointments, including that of instructor at the École de Guerre, and was promoted colonel in 1920. At the outbreak of the World War he was commanding an infantry regiment, but he was immediately given a brigade and then a division, and he acquitted himself so well during the opening weeks of the struggle that he was advanced to the command of an army corps in Artois in Oct. 1914. He greatly distinguished himself on the occasion of the French offensive near Arras in May 1915, where his corps completely broke through the German position, though exploitation proved to be impossible for want of reserves. Soon afterwards he was given command of the II. Army. When preparations were being made in the summer for the contemplated offensive

in Champagne, he was called upon to aid Gen. Castelnau in framing the plans and in carrying them out. Then, when the Germans in the following Feb. were gaining ground very rapidly before Verdun and the safety of the place of arms hung in the balance, Castelnau was sent to stabilize the defence. A few days later, having provided for the indispensable, Castelnau handed over control of affairs to Pétain, who took the battle in hand with method and energy, fought the attack to a standstill and saved Verdun. He was rewarded by being made a Grand Officer of the Legion of Honour and was placed in command of the group of armies of the Centre.

During the following winter Gen. Nivelle succeeded Gen. Joffre as commander-in-chief. Pétain's group of armies was not embraced in Nivelle's offensive scheme, but it was known that he was thoroughly doubtful of its success, and after its failure Pétain was appointed, first on April 27 chief of the general staff of the army, and then on May 15 commander-in-chief of the French armies on the western front. This position he took up at a moment when his troops were discouraged and mutinies were breaking out owing to severe losses, disillusionment following on over-sanguine hopes, and war-weariness, when the effects of the Russian revolution and those of America's intervention were alike difficult to discern, and when his own country was losing heart. He saw clearly that, in view of the wastage in man-power caused by three years of devastating war, an offensive project on a great scale, such as his predecessor had adventured, was impossible for the time being, and he therefore resolved first to nurse back the army to a healthy state of *moral* and then to restore its offensive powers by one or two battles with limited objectives in which victory was made certain by careful and abundant preparations. It was in accordance with this policy that he fought the Aug. battle at Verdun and that of Oct. on the Chemin des Dames, for which he was given the Grand Cross of the Legion of Honour. He established and maintained a close understanding with Sir D. Haig, and when the British V. Army was virtually rolled up near St. Quentin in March 1918, his promptitude in despatching reinforcements to the point of danger did much to relieve the critical situation. After Foch became generalissimo, portions of Pétain's forces played the leading part in the decisive counter-stroke near Soissons which first turned the scale, and during the subsequent victorious operations of the Allies, the French commander-in-chief was most successful in coördinating the advance of his forces at all points along a very extended front, maintaining his liaison with the British on the one flank and the Americans on the other, and in the case of the latter taking an active part in the preparation of their two offensives. He was created marshal of France on the conclusion of hostilities, in recognition of his brilliant services during the war, and he was the recipient of many high honours from the Allied Governments. He subsequently held the position of vice-president of the Conseil Supérieur de la Guerre.

PETERS, KARL (1856–1918), German traveller (*see* 21.300). In 1907–8 Peters, who had again taken up residence in Germany brought actions for libel against a Munich journal and the *Cologne Gazette*, seeking to clear his character in regard to his administration in E. Africa. These actions wrought no change in public opinion in Germany and Peters remained on the retired list. However, in April 1914, at the instance of the Imperial Colonial Office he was granted a pension. During the World War he supported the extreme pan-German programme. In Feb. 1918 he published an autobiography, and he died at Woltorf, Brunswick, on Sept. 10 of the same year. He had lived to see German E. Africa, which he founded, conquered by British and Belgian troops.

PETERSON, SIR WILLIAM (1856–1921), British educationalist, was born at Edinburgh May 29 1856, the son of John Peterson, a merchant. He was educated at Edinburgh high school and University, and after being for a short time at Göttingen, in 1876 obtained the Ferguson classical scholarship and entered Corpus Christi College, Oxford. On leaving Oxford he was at first assistant master at Harrow, but in 1879 became assistant

fessor of classics at Edinburgh. In 1882 he was made first principal of the newly founded University College at Dundee, but in 1895 he was appointed principal and professor of classics at McGill University, Canada. During his 24 years' tenure of this important position the university greatly progressed, and the scientific faculties in particular advanced considerably. In 1915 he was made K.C.M.G. In 1919 he was incapacitated by a stroke, and resigned his position, and being taken to England died at Hampstead Jan. 4 1921.

Sir William Peterson was for some years chairman of the Carnegie foundation for the advancement of teaching in America. His published works include editions of Quintilian's *Institutes of Oratory* (1891); the *Dialogue on Orators* of Tacitus (1893 and 1914); the *Speech of Cicero for Cluentius* (1895 and 1899); the *Cluni MS. of Cicero* (1901) and *Cicero's Verrine Orations* (1907); besides *Canadian Essays and Addresses* (1915).

PETROLEUM (see 21,316*).—Under the stimulus of increased consumption and many new uses for petroleum products, the search for petroleum both in the older producing countries and in new territories, often remote from civilization, was rewarded by important extensions and discoveries and, in many instances, by subsequent development, with the result that between the years 1908 and 1920 the world's petroleum production more than doubled. The increase is shown in the following table from the U.S. Geological Survey:—

World's Production.

Barrels of 42 U.S. Gal.			
1908	285,552,746	1915	427,740,139
1909	298,610,405	1916	459,411,737
1910	327,937,629	1917	508,687,302
1911	344,174,355	1918	514,729,354
1912	352,446,598	1919	544,885,000
1913	383,547,399	1920	694,854,000
1914	403,745,652		

In the period 1908-21 many prolific fields in the United States were developed, enabling that country to keep its preëminent position; Mexico grew from unimportance to second position; Argentina, Venezuela, Trinidad, Egypt and Persia developed production of commercial importance; Russia added the Maikop and Ural-Caspian fields, and Japan the Akita prefecture. In 1920 the United States produced 63.8% of the world's output, and up to the end of that year had produced 62.1% of the world's total commercial yield. The rank of the various petroleum-producing countries is shown in the table given below:—

United States Geological Survey—World Production of Petroleum.

Country	Production, 1920				Total production, 1857-1920				
	Barrels of 42 U.S. gal.	Metric tons	Cubic meters	Per cent of total by volume	Date of First Production	Barrels of 42 U.S. gal.	Metric tons	Cubic meters	Per cent of total by volume

NORTH AMERICA

United States.—Petroleum production in the United States in 1920 totalled 443,402,000 barrels. The following table from the U.S. Geological Survey gives the production of the important divisions in 1920 and in 1908, stated in bar. of 42 U.S. gallons:—

	1920	1908
Appalachian . . .	30,511,000	24,945,517
California . . .	105,668,000	44,854,737
Lima-Indiana . . .	3,059,000	10,032,305
Rocky Mountain . . .	17,517,000	397,428
Illinois . . .	10,772,000	33,686,238
Mid-Continent . . .	249,074,000	48,823,747
Gulf . . .	26,801,000	15,772,137
Others . . .	—	15,246
Total . . .	443,402,000	178,527,355

The Appalachian area extends across the Appalachian Plateaus from south-western New York to Tennessee. It includes Kentucky, W. Virginia, Pennsylvania, New York and eastern Ohio. Oil and gas sands occur throughout a long stratigraphic interval, including rocks ranging in age from Ordovician to Carboniferous. Petroleum from the Appalachian area is a high-grade paraffin oil, the average gravity being about 45° Baumé (0.8,000 sp.gr.). The average for Kentucky is not quite so high. The Appalachian district is the oldest oil-producing area in the United States (see 21,317), and while a gradual decrease in its production from 1912 was shown, high prices and great demand resulted in substantial increases in 1919 and 1920. That the rate of decline was so slow is due to the remarkable thrift of small producers who have found it profitable to operate leases where production is one-sixth of a barrel a day and sometimes even less. A factor which has tended to revive and increase production in certain Pennsylvania districts is the so-called "water drive," by which water pressure is put on the rock to supplement the exhausted gas pressure. An instance of the result of the water drive is shown by figures of an eastern pipe-line attached to nearly 18,000 wells in the Bradford and Allegheny pools; this line in 1909 ran 1,531,000 bar.; in 1913 1,267,000 bar., a decrease of over 17%; and in 1920 the amount had risen again to about 1,568,000 bar., showing an increase in eight years of 23.8 per cent.

The Lima-Indiana field covers north-western Ohio and north-eastern Indiana, the oil being obtained from lenses or discontinuous layers in Trenton limestone. The average gravity is about 39° Baumé (0.8,285 sp.gr.), although some of the oil is much heavier. The Lima-Indiana field is steadily declining.

The principal productive area in the Illinois field is in the south-eastern part of the state, but there are also small scattered pools in central and western Illinois. Most of the oil is obtained from beds of sandstone in the Pennsylvania and Mississippian series of the Carboniferous system. In gravity the oils range from 27° to 37° Baumé (0.8,917 to 0.8,383 sp.gr.). This field is also declining.

In the period between 1908 and 1921, the greatest increases in production in the United States occurred in the mid-continent field, embracing Oklahoma, Kansas, northern and central Texas, northern Louisiana and southern Arkansas. In 1920 the mid-continent field

accounted for 249,074,000 bar., or 56.2% of the total U.S. production. Pools are scattered throughout the area and new pools are constantly being discovered. Most of the oil produced in Kansas, Oklahoma and northern Texas is obtained from beds of sandstone in formations of the Pennsylvanian series (Upper Carboniferous). The oil produced in southern Oklahoma is mainly from several pools in beds of sandstone of the Pennsylvanian series, though some oil is found in the "red beds" of the Permian series (latest Carboniferous). The oil found in northern Louisiana and central Texas is obtained from sandstone or other porous rocks of the Cretaceous and Tertiary systems. The average oil from the mid-continent field is of about 35° Baumé (0.8,485 sp.gr.), ranging from the thick black oil of some of the Louisiana fields, which has a gravity of 21° Baumé (0.9,272 sp.gr.), to the high-grade Cushing oil of above 55° Baumé (0.7,568 sp.gr.). The Glenn pool discovery in Creek county, Okla., in 1907 led to a great petroleum development in that state. This pool reached a maximum production of 125,000 bar. a day, sustained from Aug. 1907 to Feb. 1908. In 1912 the famous Cushing pool, also in Creek county, was discovered. In the latter part of 1913 a well in the Cushing pool was drilled to the Bartlesville sand at 2,600 ft., and resulted in a large gusher and the inauguration of an unprecedented drilling campaign. The oil was the highest-grade crude yet discovered W. of the Appalachian fields. Gusher wells were brought in with frequency, and the production of the pool, which at the end of 1913 averaged about 25,000 bar. a day, was averaging at the end of 1914 over 225,000 barrels. There was a temporary decline early in 1915, but in April production had increased to almost 300,000 barrels. Subsequently it reached a maximum of 320,000 bar., sustained for a 60-day period. The Cushing production was of such high grade and so large that it broke the oil market. In June 1915 the flush production of the field had been exhausted and a decline began. Cushing in 1915 yielded 17% of the total quantity of oil marketed in the United States. The Cushing pool early in 1921 was producing about 27,000 bar. a day.

In 1914 the rich Augusta pool in Butler county, Kan., was opened up, and in 1915 the El Dorado pool, also in Butler county, was discovered. In 1916-7 the Towanda extension of the El Dorado pool resulted in the district increasing its output from an average of between 15,000 and 20,000 bar. in the first five months of 1917, to 40,000 bar. in June and to nearly 100,000 bar. for a few days in September. The wells in the Towanda extension were of large capacity but proved to be short-lived, and the El Dorado-Towanda pool declined to about 50,000 bar. before the end of the year. The pool early in 1921 was producing about 29,000 bar. a day.

Late in 1917 the discovery of oil in a well 3,450 ft. deep, a mile and a half S. of the town of Ranger in central Texas, stimulated a most sensational development, covering possibly the widest "boom" area in the history of petroleum in the United States. This was generally termed a "deep sand" development, and opened up extensive pools in Eastland county, Stephens county and a portion of Comanche county in 1918. Oil in the deep sand pools is obtained from several different horizons in the so-called Bend series, which is of Pennsylvanian and Mississippian age. In July 1918 a prolific well was drilled in at 1,735 ft. in the Burkburnett field in Wichita county, northern Texas, and Burkburnett was the scene of another great oil boom. The Ranger field reached a maximum capacity of about 15,000 bar. a day in the middle of 1919, but declined thereafter. It was producing 57,000 bar. on Jan. 1 1920 and 14,000 bar. on Dec. 31 1920. The Stephens county pool (where development was slower) was producing about 37,000 bar. daily at the beginning of 1920 and had increased its production to close to 130,000 bar. at the end of that year, subsequently declining to about 90,000 bar. in May 1921. The Burkburnett pool, following the opening up of the Burkburnett extension, reached a maximum yield of over 100,000 bar. daily in 1919, from which peak it gradually declined in 1920. Early in 1921 it was producing about 60,000 bar. daily.

Another important development in the mid-continent field was the discovery in Sept. 1918 of oil in a shallow well near Homer, Claiborne parish, in northern Louisiana. A large gusher at greater depth was brought in in Aug. 1919, and the boom scenes of Ranger and Burkburnett were transferred to Shreveport, La. (the headquarters of the Claiborne parish development), where late in 1919 and early in 1920 other large wells yielding as high as 30,000 bar. daily were brought in in the Homer pool. From a production of about 5,000 bar. at the beginning of 1920 the Homer pool reached a production of over 100,000 bar. in a few months. This output declined rapidly because of the quick decrease in production of the larger wells, but an average output of about 50,000 bar. daily was maintained during the latter part of 1920 and the early months of 1921. Geologically the northern Louisiana producing area is in what is known as the Sabine Uplift, an uplift of considerable magnitude in the Coastal Plain sediments, the nature and age of which have not been definitely determined. One of the most important developments of the early part of 1921 was the discovery of oil in commercial quantity in southern Arkansas. The discovery well was brought in near El Dorado in Union county, and rapid drilling of subsequent wells increased the potential production of the new pool to between 0,000 and 60,000 bar. a day by April 1921.

Several important pools were opened up in the Gulf coast field, which first came into prominence in 1901 when the Spindletop pool

in Jefferson county, Texas, was developed. The Gulf coast field includes southern Texas and southern Louisiana, and the petroleum is associated with masses of rock salt and gypsum in domes. The age of the oil-bearing strata ranges from Cretaceous to Quaternary. The field includes a great number of small scattered pools, some of which have developed wells of enormous productivity. The gravity of the oil ranges from 15° to 30° Baumé (0.9,655 to 0.8,750 sp.gr.), an average of about 22° Baumé (0.9,211 sp.gr.). Among the more important pools of the Gulf coast are the Goose Creek, Hull, Humble, W. Columbia and Damon Mound pools. West Columbia attracted attention in 1920 when on July 20 the pool was extended by a well flowing at the rate of 26,000 bar. daily. This flow was practically sustained until Aug. 28, when the well rapidly declined.

The Rocky Mountain field, which embraces the areas of production in Colorado, Wyoming and Montana, as well as prospective production in Utah and New Mexico, was stimulated by the drilling in of a large well in the Salt Creek pool, Natrona county, Wyo., in April 1912. This started a general boom in Wyoming, which state supplies the bulk of the Rocky Mountain production. Petroleum in the Rocky Mountain field is obtained from strata of the Carboniferous and Cretaceous age. Oils from older strata range in gravity from 18° to 24° Baumé (0.9,459 to 0.7,865 sp.gr.) and are of paraffin base. The development of the richest part of the Wyoming fields was restricted until 1920, pending passage of legislation and issuance of regulations with respect to Federal public lands. The Wyoming field includes a large number of small pools, and the greatest production is obtained from the Salt Creek pool, which early in 1921 was producing about 50,000 bar. daily.

The California field, one of the most prolific in the United States, is divided into two geographic groups, one occupying two sides of San Joaquin Valley and commonly known as the valley fields, and the other occupying a large area along the coast and commonly known as the coastal field. All the valley fields, except one, lie on the west side of San Joaquin Valley, and the oil in most of them is obtained from porous Tertiary sandstone. The conditions in the coastal fields are in many respects similar. A very small part of the oil produced in California is obtained from Cretaceous formation. The oils range in gravity from 9.09° to 54° Baumé (1.000 to 0.7,60 sp.gr.), and heavy oils, containing little sulphur, predominate. The fair average gravity is about 21° Baumé (0.9,272 sp.gr.).

California for many years was the leading oil-producing state. It was supplanted by Oklahoma in 1907 and 1908 but regained first place in 1909. California held this position until 1915 when its production declined, while Oklahoma's output, because of the Cushing production, greatly increased, Oklahoma again taking first place. Oklahoma held first place through 1920 with California a close second. The principal producing districts of California are: the Kern River, McKittrick, Midway-Sunset, Lost Hills and Belridge districts, in Kern county; the Coalinga field, in Fresno county; the Lomp and Santa Maria fields in Santa Barbara county; the Ventura and Newhall fields in Ventura county; and the Los Angeles and So Lake and Whittier-Fullerton fields in Los Angeles county. The largest production is obtained from the Midway-Sunset field, which in 1920 produced 37,917,010 bar., a daily average of 103,598 barrel. The Los Angeles and Salt Lake field produced 28,694,163 bar., a daily average of 78,399 bar.; the Coalinga field 15,464,198 bar., a daily average of 42,252 barrels. Important addition to production in the Midway-Sunset field was made in 1920 and 1921 by the development of the Elk Hills district, where large wells ranging from 2,000 to 6,000 bar. were brought in. Production of this district increased from 25,000 bar. per month during Dec. 1919 to 1,500,000 bar. during Dec. 1920.

Oil shale deposits are found in Colorado, Utah, Wyoming, Nevada, Montana, California, Texas, Kentucky and W. Virginia in the United States, but while extensive experimental work has been done on retorting and much chemical investigation has been conducted to the nature, properties and behaviour of oil shale, the establishment of the industry on a commercial scale has not yet been accomplished in the United States. By far the greatest attention has been paid to the oil shales of the western states.

Alaska.—Oil has been found in several localities in Alaska, notably in the district between Icy Cape and Cape Yatag, 400 m. N. W. of Sitka; in the Kayak field, several miles inland from Cape Suckling in the Cook's Inlet field, between Itimma Peak and Itimma Lake and in the Cold Bay field, opposite Kodiak Islands. Wells were drilled in the early 'nineties in the Kayak, Cook's Inlet and Cold Bay regions, but oil was not found in commercial quantity. In 1921 interest in Alaskan fields was revived, but no important drilling operations were reported. Production was 56,000 barrels.

Canada.—Canada's petroleum production declined steadily from 1908 to 1920. In 1920 the output totalled 198,425 bar. compared with 241,000 bar. in 1919 and 528,000 bar. in 1908. Virtually all of Canada's petroleum is produced in Ontario, and occurs in sandstone and limestone of Silurian and Devonian age. The gravity is about 30° Baumé (0.828 sp.gr.). A small production is obtained in New Brunswick and Alberta. In Aug. 1920 oil was discovered on the Mackenzie River, 150 m. S. of the Arctic Circle in the Canadian North-west Territory. The well was located N.W. of Fort Norman, and on Aug. 23 1920 it began to flow over the top of the mast from a depth of 40 feet. After an uninterrupted flow of 40 minutes the well was closed.

The oil was analyzed as 38° Baumé (0.8,333 sp.gr.). This development attracted prospectors, the Dominion Government promulgating new regulations to apply to the unorganized districts affected by the discovery. Drilling in the Peace River district of the Northwest Territory also attracted attention in 1920 and 1921.

Mexico.—Mexico's petroleum development has been sensational in its rapid growth. Although yielding oil as early as 1901 it was not until 1910 that the production became a commercial factor. In the latter part of that year the famous Juan Casiano No. 7 well was drilled S. of the Dos Bocas well, the latter an uncontrolled gusher S. of Tampico, struck July 4, 1908, which went to salt water several months later. The equally famous Potrero del Llano No. 4 well came in Dec. 27, 1910 with an estimated initial flow of 10,000 bar. daily, increasing to 160,000 bar., and establishing itself as the largest producer up to that time. Both the Casiano and del Llano wells were in the so-called southern field as distinguished from the northern or Panuco field, these two fields being part of the Tampico-Tuxpam region. This lies in the northern part of the state of Vera Cruz and the southern part of the state of Tamaulipas. Oil in the Tampico region occurs in the Oligocene, Eocene and Cretaceous formations and is found in numerous pools. Before striking the big wells mentioned a considerable production had been developed at Ebano, 40 m. W. of Tampico, in the northern part of the Tampico-Tuxpam area and in the Tehuantepec area. The Tehuantepec-Tobasco area extends along the Gulf coast in southern Vera Cruz and the state of Tabasco. Its oil-bearing rocks are of the Pliocene and Pleistocene age, and it had not developed a large production up to 1921. Mexican crude oil ranges from 10° to 43° Baumé (1.000 to 0.8,092 sp.gr.), and generally becomes lighter from north to south. In the Panuco (northern) field it is from 10° to 14° Baumé (1.000 to 0.9,722 sp.gr.), and from 15° to 29° Baumé (0.9,655 to 0.8,805 sp.gr.) in the southern districts. Oil in the Tehuantepec field has a gravity of 32° Baumé (0.8,642 sp.gr.).

Generally speaking, Mexico's petroleum has been found in a succession of great gushers. Where these wells are isolated they have produced for long periods and in great volume. Where there is close and competitive drilling the exhaustion of the pools comes as a natural consequence. The explanation of the great gushers seems to lie in the very great porosity of the rock. Oil collects in a net-work of caves and channels previously dissolved out of a bed of thick limestone. This condition allows the petroleum to move about freely, while still underground. Furthermore, the petroleum generally lies over water under an artesian head, and as a consequence the field pressure is largely hydrostatic, causing the oil to flow. In 1908 the country was credited with an output of 3,932,900 bar.; in 1920, 163,000,000 barrels. The following table shows the production during that period:—

*Petroleum Production of Mexico, 1908 to 1920.**

	Barrels	Metric Tons
1908	3,932,900	624,968
1909	2,713,500	431,175
1910	3,634,080	577,455
1911	11,552,798	1,994,640
1912	16,558,215	2,631,100
1913	25,696,291	4,083,141
1914	26,235,403	4,168,805
1915	32,910,508	5,229,480
1916	40,545,712	6,445,957
1917	55,292,770	8,790,583
1918	63,828,327	10,147,587
1919	87,072,954	13,843,077
1920	163,000,000	22,638,888

*Boletín del Petróleo; 1920 estimated.

In Jan. 1914, in the Panuco pool, a well with an estimated initial flow of 100,000 bar. daily was brought in, and further attention was attracted to this district in 1915 by the completion of an offset well estimated at 60,000 bar. daily. Political disturbances in Mexico from 1914 to 1917 seriously interrupted operations in the southern field. On Feb. 10, 1916, however, Cerro Azul No. 4 well in the southern district was completed. This well was credited with having flowed 260,858 bar. on Feb. 19 of that year, being estimated the largest producer ever drilled, and in May 1921 was continuing its steady yield. In Aug. 1914 seepages from Potrero del Llano were ignited by lightning, and the fire was not extinguished until March 1915. The completion of a good-sized well in 1915 in the Tepetate pool, a short distance N.W. of Casiano, was the precursor of the intensive lot-drilling campaign which this district saw in 1918 and 1919. In those years about 20 wells of large initial capacity were completed in this pool. The Alamo pool, the southernmost producing area in the Tampico-Tuxpam region, came into prominence in Oct. 1914, when the famous Alamo No. 2 well was brought in with an estimated potential production of 50,000 barrels. This well has probably produced 27,000,000 bar. of oil. The oil in the Alamo pool is from 16° to 22° Baumé (0.9,589 to 0.9,211 sp.gr.). Large wells of low-grade oil have been developed in the Molino field, just N. of Alamo. In 1919-20 large gushers were completed in the so-called Naranjos pool in the southern field. It was estimated that this pool produced 90,000,000 bar. in 1920, possibly the largest output in

history. Potrero del Llano No. 4 suddenly went to salt water in Dec. 1918. This occurrence caused wide comment, as it was the first instance of the approximate exhaustion of any of Mexico's prolific pools, if Dos Bocas is to be excepted. This well had produced up to that time about 100,000,000 bar. of oil, including seepage oil. The Juan Casiano No. 7 well went to salt water in Nov. 1919, having produced about 80,000,000 bar. of oil. Many of the large wells in the Tepetate pool were affected by salt water in 1919 and 1920. Salt-water invasion was also reported as serious in the Panuco field. The Zacamixtle pool in the southern district was discovered in 1920, yielding several large wells. In 1921 important wells were brought in in the Toteco district of the southern field between Zacamixtle and Cerro Azul. In 1920 it is estimated that this field produced 120,000,000 bar., all in a strip of land 42 m. long and less than a mile wide.

Central America.—No petroleum production has been developed in Central America, but prospecting has been done and some drilling was under way in 1920. Test wells have been sunk on Columbus I., east coast of Panama, and in the Estrella Valley of Costa Rica. Exploration work has been done in Honduras and Guatemala.

SOUTH AMERICA

Argentina.—Argentina's commercial production dates from 1908, when petroleum was found in a well being drilled for water by the Government near Comodoro Rivadavia, Chubut province, on the coast of Patagonia. The Government immediately reserved part of the oil-bearing land for a monopoly, and Argentina's petroleum development has been almost entirely in the hands of the administration. Oil occurs in nearly horizontal, supposedly Cretaceous, beds which are covered by Tertiary beds. The oil is heavy and of asphalt base and ranges in gravity from 18.9° to 21.8° Baumé (0.940 to 0.922 sp.gr.). Much attention was attracted to Argentina in 1921, when in Feb. the first large gusher to be opened in the Comodoro Rivadavia field came in with an estimated initial flow of 25,000 bar. daily. Argentina's oil production was 1,665,989 bar. in 1920, compared with 1,183,000 bar. in 1919.

Venezuela.—Active prospecting in Venezuela began in 1910, and during the next four or five years wells were drilled in several areas with varying success. A well in the Mene Grande field, on the east coast of Lake Maracaibo, Sucre district, drilled in 1913, established the occurrence of oil in paying quantity, and by 1915 the field had developed a considerable production, furnishing up to 1921 practically all the Venezuelan output. Drilling in the district of Colón, state of Zulia, commenced in 1914. Four wells credited as good producers in the Rio Oro and Rio Tarra sections had been completed by 1916 and were shut in. Two wells reported as proven in the Bolivar district, state of Zulia, were also capped. Operations in Venezuela in 1920 and 1921 were active, particularly in the Lake Maracaibo district. Venezuela's production in 1920 amounted to 456,996 bar., compared with 425,000 bar. in 1919. In 1920 the Mene Grande field was credited with having seven flowing wells, the oil being of about 16° Baumé (0.9,589 sp.gr.). The capped wells in the Rio Oro district are said to produce a high-grade, paraffin-base oil of about 36° Baumé (0.8,433 sp.gr.).

Colombia.—Although not ranking as an oil-producing country, in 1920 Colombia was credited with three wells of potential commercial importance. These were completed in 1918 and were shut down awaiting marketing facilities. The wells were drilled on a concession in the Rio Colorado region in Santander del Sur. They are located about 30 m. S. of Barranca Bermeja, which is 350 m. from the mouth of the Magdalena river. Oil from these wells is reported to test 26° to 31° Baumé (0.8,974 to 0.8,606 sp.gr.). Preparations for opening the wells had been made early in 1921 upon the completion of a pipe line and refinery. Drilling was accomplished in 1920 and 1921 on other concessions along the Magdalena river in the vicinity of the pioneer Colorado development. Development work was also undertaken in 1920 on a concession in the Venezuelan boundary region in Santander del Norte, on the Rio del Oro, opposite drilling work in the Colón district of Venezuela. Considerable interest was attached to Colombia petroleum development in 1911 when drilling was undertaken near Cartagena. In 1913 and 1914 wells were drilled in the Loricó district near the Sinu river, but production was not encountered in commercial quantity. The Magdalena-Santander field occurs in the Cretaceous limestone and sandstone and the coal-bearing Lower Tertiary (probably Oligocene) beds. The rocks of the Caribbean fields are similarly described.

Peru.—Peru has the distinction of being the oldest oil-producing country in S. America, first being credited with production in 1896. Its production has been steadily maintained, the principal fields being Negritos, Lobitos and Zorritos. Another petroliferous district near Lake Titicaca has not developed any considerable production. Oil is found chiefly at the north end (Pacific coastal district) of Peru, and occurs in several horizons of soft sandstone and shale of early Tertiary age. The oil ranges from 32° to 48° Baumé (0.8,642 to 0.7,865 sp.gr.). Peru's production in 1920 was 2,816,649 bar.; 1919, 2,616,000 bar.; 1908, 1,011,180 barrels.

Bolivia and Ecuador have been actively prospected for oil, but oil in commercial quantity has not been developed. Chile had several oil booms, particularly those based on the oil deposits of the province of Punta Arenas, N.W. of Tierra del Fuego, without successful results. Prospecting has been undertaken in Brazil and Uruguay.

WEST INDIES

Trinidad.—The oil fields of Trinidad are mainly in the southern part, and the oil is obtained from lenses of sandstone of Tertiary age. Trinidad first appeared as an oil producer in 1908, although wells were known to exist N. of the famous Pitch Lake at Guayaguayare, in the extreme S.E. of the island, in 1902. This district came into real prominence in 1908 when a well at 700 ft. spouted oil over the derrick. A rapid development followed. Oil in the Pitch Lake district varies in density from 14° to 25° Baumé (0.9,722 to 0.9,032 sp.gr.). In the latter part of 1911 regular oil shipments from Brighton began. In that year several large gushers were brought in, but immediately clogged, owing to sand. In 1913 a well came in rated at 40,000 bar. daily, but sanded up, and in subsequent years other large producers have been reported, the initial production of which has soon fallen off on account of sand. Trinidad's production in 1920 totalled 2,083,027 bar., compared with 1,841,000 in 1919.

An oil boom in Cuba in 1917 failed to yield any considerable production. The principal development was in a field near Havana. Prospecting and a little drilling work have been done in *Santo Domingo*. There was exploration work in *Barbados* and in *Haiti*.

EUROPE

Russia.—While Russia, as a result of the World War and the revolution that followed, dropped in world rank as regards petroleum production, it remained the largest European producer. Production is found in Tertiary clays and sands. Baku oils are of about 27° Baumé (0.8,917 sp.gr.), while in the Suraghany district of Baku province the oil is as high as 48° Baumé (0.7,865 sp.gr.). The production in 1920 was estimated at 25,429,600 bar.; 1919, 25,498,000; 1918, 40,456,182; 1917, 69,960,000; and in 1908, 62,186,447. The relatively small area comprising the Baku field supplies the bulk of Russia's production. Other productive fields are the Grozny, Maikop, Ural-Caspian (Emba) and Tchelenken fields. The Maikop field in the province of Kuban on the north flank of the Caucasus, N.E. of the Black Sea, was discovered in 1910. The finding of high-grade oil in a well flowing at the rate of 37,500 bar. daily caused an extraordinary rush. In 1915 the sensation in this field was the completion of a gusher credited with an initial flow of 60,000 bar., which maintained a large, steady production from March 23 to the close of the year. Maikop oil is about 40° Baumé (0.8,235 sp.gr.). The Ural-Caspian field, covering a large area in the Emba-Uralsk region round the north end of the Caspian Sea, first became a commercial factor in 1913. The district came into prominence on the completion of a well in May 1911, which at a depth of 732 ft. gushed with great violence. It began to flow in Feb. 1912, was closed down and reopened in Oct. 1912, producing 120,000 poods (1,944 tons or 14,480 bar.), and then settling down to 50,000 poods. (One pood equals 36.112 lb.) This famous gusher is estimated to have produced from 8,500,000 to 9,000,000 poods. Emba oil is about 28° Baumé (0.8,861 sp.gr.).

For many years the I. of Tchelenken, off the Asiatic coast of the Caspian Sea near Krasnovodsk, was the scene of moderate operations, but from 1911 onwards large yields were obtained from wells sunk in the Ali Tepe district in the south-western part. Tchelenken oil is about 22° Baumé (0.9,211 sp.gr.).

Galicia.—No new pools of importance were discovered in Galicia during the period 1908-20. Galician production showed a declining tendency beginning in 1910, and during the World War this condition was aggravated, as the fields were battlegrounds. Galicia's largest output is obtained from Eocene beds. The chief producing districts are: in eastern Galicia, Boryslaw-Tustanowice, Bitkow; in western Galicia, Bobrka, Potok and the Gorlice district. The bulk of Galicia's production comes from the Boryslaw-Tustanowice district. Boryslaw oil is 32° to 34° Baumé (0.8,642 to 0.8,537 sp.gr.), and is the standard market grade for Galicia. Bitkow oil is about 53° Baumé (0.7,650 sp.gr.); Bobrka, about 31° Baumé (0.8,696 sp.gr.); Potok, 34° to 45° Baumé (0.8,537 to 0.8,000 sp.gr.). Galicia's production in 1920 totalled 5,606,116 bar.; 1919, 6,054,000. The peak of production was in 1909, 14,932,799 barrels.

Rumania. like Galicia, a battleground during the World War, suffered in petroleum production. Most of the oil is obtained from Miocene and Pliocene beds, but part is obtained from Eocene and Oligocene and possibly from Cretaceous beds. The principal fields are Bushtenari, Campina, Moreni, Filipeshiti, Baicoi and Bauzau. The oil is from 25° to 45° Baumé (0.9,032 to 0.8,000 sp.gr.). Production in 1920 was 7,435,344 bar.; 1919, 6,614,000; and in 1908, 8,252,157. The peak was reached in 1913, 13,554,768 barrels.

Yugoslavia.—In 1921 drilling began on concessions in Croatia.

Germany.—Oil is obtained largely at Hanover, where it occurs in domes associated with rock salt. The rocks are chiefly limestone and sandstone of upper Jurassic age. Oil at shallow depths is heavy, gravity from 17° to 19° Baumé (0.9,524 to 0.9,396 sp.gr.); at greater depths the oil is lighter. The production is not large, and in 1920 was 212,046 bar.; in 1919, 234,000.

France.—Production in Alsace occurs in sandstone of Eocene and Oligocene age and is comparatively small. The gravity ranges from 25° to 29° Baumé (0.9,032 to 0.8,805 sp.gr.). In 1920 the output was about 388,700 bar.; in 1919, 344,000.

Italy.—Italy's production, relatively small, is chiefly in the Emilia district of Lombardy on the north-eastern slope of the

Apennines. Oil occurs in sandstones of Eocene and Miocene age, and ranges from 31° to 48° Baumé (0.8,696 to 0.8,187 sp.gr.). Production in 1920 amounted to 34,180 bar.; in 1919, 35,000; and in 1918, 50,966.

Great Britain.—Apart from the shale-oil industry of Scotland and Wales, Great Britain took its place as a petroleum-producing country in 1919, when the Hardstoft well was brought in in Derbyshire. This was one of 11 drilling locations, seven of which were in Derbyshire, two in N. Staffordshire and two in the Midlothian district of Scotland. The Hardstoft well was started in Oct. 1918, and struck oil in May 1919 at 3,078 ft. At 3,100 ft. it produced 10 or 11 bar. daily. The well was still overflowing naturally at the end of 1920. Up to that time its production totalled 4,575 bar. or 590 tons, of which 2,909 bar., or 375 tons, were produced in 1920. At the end of that year progress on the other prospecting wells stood as follows: six wells had reached 3,000 ft. or over, the deepest, Ironville No. 2 in the Derbyshire area, being shut down at 4,500 ft. pending results of Ironville No. 1. One new well was started in 1920, Apedale No. 2 (Staffordshire), to replace Apedale No. 1, which had to be abandoned. This development is undertaken by the British Government, although the operations are managed by a private company. Oil from the Hardstoft well tested 40° Baumé (0.8,236 sp.gr.).

Considerable production of petroleum is derived from the Scottish shale-oil fields in the territory from Dalmeny and Abercorn on the Firth of Forth southward to the district of Cobbinshaw and Tarbrax. The oil-shale industry in Scotland has been in commercial operation since 1850, and in 1920 there were 25,000 persons regularly employed in this enterprise. In 1917 3,116,529 long tons of oil were produced from Scottish oil-shale. There is a small oil-shale production in England and in Wales.

AFRICA

Egypt.—Prospecting in Egypt resulted in the discovery of oil on the borders of the Red Sea and the development of small production in 1911. In 1913 several large wells were brought in in the Gensah district on the west shore of the Red Sea, near the junction of the Red Sea and the Gulf of Suez. In Oct. 1914 oil was struck in the Hurgada district, S. of Gensah, and up to 1921 Egypt's production had been confined to these districts. The oil occurs in sandstone and in cavernous, dolomitic limestone, associated with thick beds of gypsum of Miocene (Tertiary) age, accompanied in some places by thick beds of salt. The underlying Nubian (Cretaceous) sandstone also contains some oil. Egyptian oil is about 40° Baumé (0.8,235 sp.gr.). Difficulties from salt-water flooding have been encountered in the fields, shortening the life of the large wells. Exploitation has been restricted to a comparatively small area. While Egypt's production almost doubled in 1918 as a result of increased activities that year it fell off in 1919, and in 1920 showed a sharp decrease. Production in 1918 was 2,079,750 bar.; in 1919 1,501,000; and in 1920, 1,042,000.

French Colonies.—Some oil has been obtained in the Cheliff river area in the district of Oran, Algeria. Over 30 wells have been drilled in the M'Sila and Medjila districts, but during the World War operations were practically discontinued. Interest in Algeria revived after the war. The oil-bearing formation is probably Upper Miocene and its structure is complex.

Prospecting has been active in Angola and Ashanti (Gold Coast), in the Tertiary coastal plain formations. Tests have been drilled in Angola and the Alto Daude district near Loanda and at Ambriette. Showings of oil were reported in test wells drilled in the Betsiriry Valley, Madagascar, but no commercial production developed.

ASIA

Persia is looked on as a new petroleum-producing country of unusual importance. Development has been virtually confined to the Maidan-i-Naphtun field in northern Arabistan, about 100 m. N. of the head of the Persian Gulf, where the first wells were completed in 1908. In 1914 10 wells were reported as being operated, and 20 more were shut down at the top of the sand. In the neighbouring Maidan-i-Naphtek field one well had been drilled and capped and a second begun. One test well had started in the White Oil Springs district. The following year a total of 12 wells had been completed in the Maidan-i-Naphtun field. The wells were reported to be prolific, with a combined capacity of 5,000,000 tons a year. Early in 1920 it was stated that the wells still maintained their high rate of yield. One well, which has been continuously flowing since Nov. 1911, was giving a larger production than ever, maintaining a steady daily average of 11,000 bar. with the well only partly opened. Persian production in 1920 was 12,352,655 bar.; in 1919, 6,412,000; in 1918, 6,856,063. Oil in the chief producing area occurs in the Miocene series. The gravity of the oil is about 21° Baumé (0.9,272 sp.gr.). In addition to the Maidan-i-Naphtun field, the Ahwaz-Pusht-i-Kuh and Gishon I. and the Persian Gulf regions are expected to yield petroleum.

Mesopotamia.—There are several petroliferous areas in Mesopotamia in the Tigris-Euphrates basin. Primitive development has yielded some oil in the Kirkuk-Mendali-Kasr-i-Shirin area north of Bagdad, in the Middle Tigris belt and in the Euphrates belt. Large scale development of the Mesopotamian fields was interrupted by the war, but interest in them revived in 1920 and 1921.

Palestine.—The first drilling for oil in Palestine, S.W. of the Dead Sea, was interrupted by the war. Prospecting had previously been active in the area between the river Jordan and Deraa, adjacent to the Hedjaz railway.
